# USB Type-C VCONN Overvoltage Protection IC

The NCP398 is an overvoltage protection device. It protects VCONN against overvoltages in applications where VCONN is directly derived from the VBUS supply.

At power up, the integrated power MOSFET is automatically controlled to reduce inrush current. The IC continuously monitors undervoltage, overvoltage and thermal events. In case of overvoltage, a very high speed comparator opens the power MOSFET instantaneously.

The part is enabled through the  $\overline{\text{EN}}$  pin. A high level on this pin allows forcing off the internal switch and drastically decreases the current consumption of the NCP398 core.

#### Features

- Over-voltage Protection up to + 28 V
- On-chip Low R<sub>dson</sub> NMOS Transistors: Typical 200 mΩ
- Over-voltage Lockout (OVLO)
- Shutdown EN Input
- Output Discharge Path
- WLCSP4 Package 0.84 x 0.84 mm, 0.4p
- UDFN6 Package 2 x 2 mm, 0.65p
- These Parts are ROHS Devices

#### **Typical Applications**

- Type-C USB
- Smartphones
- Tablets

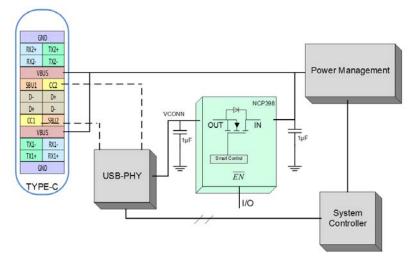

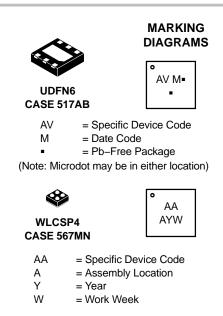

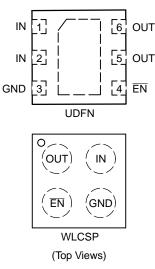

Figure 1. Typical Application Circuit

#### **ORDERING INFORMATION**

See detailed ordering and shipping information in the package dimensions section on page 11 of this data sheet.

## Table 1. CSP PINOUT DESCRIPTION

Pin	Pin Name	Туре	Description
A1	OUT	OUTPUT	Output voltage pin.
			The OUT pin must be connected to the circuitry that is to be protected (VCONN rail).
B1	ĒN	I/O	Enable pin bar. The device enters in shutdown mode when this pin is tied high in which case the output is disconnected from the input.
A2	IN	POWER	Input voltage pin. The IN pin must be connected to the input power supply (VBUS).
B2	GND	POWER	Ground. Must be connected to the system GND plane.

#### Table 2. DFN PINOUT DESCRIPTION

Pin	Pin Name	Туре	Description
1,2	IN	POWER	Input voltage pins.
			The two IN pins must be hardwired together and are connected to the input power supply (VBUS).
3	GND	POWER	Ground.
			Must be connected to the system GND plane.
5,6	OUT	POWER	Output voltage pins.
			The two OUT pins must be hardwired together and are connected to the circuitry that is to be protected (VCONN rail).
4	EN	I/O	Enable pin bar.
			The device enters in shutdown mode when this pin is tied high in which case the output is disconnected from the input.
7	PAD	POWER	DFN package back side pad. Must be connected to ground plane for thermal dissipation optimization.

#### **Table 3. MAXIMUM RATINGS**

Rating		Symbol	Value	Unit
Minimum Voltage (All to GND)		V <sub>MIN</sub>	-0.3	V
Maximum Voltage (Ins to GND)		V <sub>INMAX</sub>	29	V
Maximum Voltage (All others to GND)		V <sub>MAX</sub>	7	V
Maximum DC current		I <sub>MAX</sub>	0.8	А
Thermal Resistance, Junction to Air	WLCSP (Note 1) DFN (Note 1)	$R_{ extsf{ heta}JA}$	170 145	°C/W
Operating Ambient Temperature Range		T <sub>A</sub>	-40 to +85	°C
Storage Temperature Range		T <sub>STG</sub>	-65 to +150	°C
Junction Operating temperature		TJ	+125	°C
Human Body Model (HBM) ESD Rating are (Note 2)		ESD HBM	2	kV
Charged Device Model (CDM) ESD Rating are (Note 2)		ESD CDM	1	kV
Latch Up Current (Note 3)		I <sub>LU</sub>	100	mA
Moisture Sensitivity		MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. The R<sub>θJA</sub> is highly dependent on the PCB heat sink area. As example UDFN6 R<sub>θJA</sub> is 220°C/W with 50 mm<sup>2</sup> (copper 35 μm, 1 oz) and 145°C/W

with 200 mm<sup>2</sup> (copper 35 μm, 2 oz).
Human Body Model, 100 pF discharged through a 1.5 kΩ resistor following specification JESD22/A114, Charged Device Model (CDM) per JEDEC standard: JESD22–C101 Class IV.

3. Latch Up Current per JEDEC standard: JESD78 class II.

#### **Table 4. ELECTRICAL CHARACTERISTICS**

Min / Max limits values ( $-40^{\circ}C < T_A < +85^{\circ}C$ ) and  $V_{IN} = +5 V$  (Unless otherwise noted). Typical values are  $T_A = +25^{\circ}C$ .

Characteristics	Symbols	Conditions	Min	Тур	Max	Unit
Input Voltage Range	V <sub>IN</sub>		-	-	28	V
Under Voltage Lockout	UVLO	Vin rising	2.4	_	2.8	V
Under Voltage Lockout Hysteresis	UVLO <sub>HYST</sub>	Vin falling	-	50	-	mV
Over voltage Lockout Threshold	OVLO (Note 4)	Vin rising	5.50	5.65	5.80	V
Over voltage Lockout Threshold hysteresis	OVLO <sub>HYST</sub>	Vin falling	-	115	-	mV
Vin versus Vout Resistance	R <sub>DSON</sub>	Vin = 5 V, $\overline{EN}$ = low, 25°C, WLCSP	-	190	220	mΩ
		–40°C < T <sub>J</sub> < 85°C, WLCSP	-	230	260	
		Vin = 5 V, $\overline{EN}$ = low, 25°C, UDFN	-	230	260	
		–40°C < T <sub>J</sub> < 85°C, UDFN	-	270	300	
Supply Quiescent Current	I <sub>DD</sub>	No load. $\overline{EN} = Iow$	-	40	60	μA
OFF current	I <sub>OFF</sub>	EN = high	-	_	1.5	μA
Standby current	I <sub>STB</sub>	Vin = 2.4 V	-	-	2.5	μΑ
Output Discharge path	R <sub>PD</sub>	From EN = low to high or Vin < UVLO – hysteresis to Vout = V <sub>PD</sub>	8	10	12	kΩ
Output Discharge path level	V <sub>PD</sub>	Vout falling	-	0.63	-	V

#### EN

EN Voltage High	V <sub>IH</sub>		1.2	-	-	V
EN Voltage Low	V <sub>IL</sub>		-	-	0.4	V
EN Input Leakage Current	IEN	0 < V <sub>EN</sub> < 5.5 V	-1	0	+1	μA

### TIMINGS

Ton Time	T <sub>ON</sub>	Vin valid, From $\overline{EN}$ high to low, 90% Vout	-	0.3	1	ms
Disable Time	T <sub>OFF</sub>	From $\overline{\text{EN}}$ low to high, to 90% Vout. R <sub>LOAD</sub> 100 $\Omega$	-	10	_	μs
OVLO Turn Off Time	T <sub>OVLO</sub>	Vin exceeding V_{OVLO} at 2 V/µs to Vout starts decreasing. $R_{LOAD}$ 100 $\Omega$	-	100	-	ns

## TSD

Thermal shutdown	TSD	-	150	-	°C
Thermal shutdown rearming	TSD rearm	-	125	-	°C

4. Please contact your ON representative for additional OVLO thresholds. Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

#### Operation

The NCP398 device provides overvoltage protection when a wrong input supply is connected or voltage ringing appears on the input line. The internal NMOS Fet is soft start controlled to limit inrush current into the load (capacitors, IC wake up).

The device integrates an enable control pin, undervoltage and overvoltage comparators, and output discharge path to eliminate residual voltage after the turn off.

#### **Timings Chronogram and States Description**

The phase 1 sections described below are respectively the OFF state ( $\overline{\text{EN}}$  high) and the standby state (VIN <

UVLO) of the device. When Vin is below the undervoltage comparator (UVLO) or  $\overline{\text{EN}}$  is tied high, NCP398 will be in this state.

Phase 2 corresponds to the defined time for the gate driver soft start. Referring to the electrical parameter, this phase is aligned to Ton time.

Phase 3 is the normal operation, with Vin valid, the part enabled and there is no fault.

The behavior during an overvoltage condition is detailed in the phase number 4.

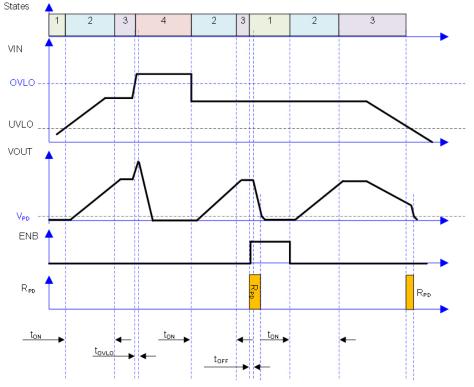

Figure 3. Timings Diagram

#### Enable Bar Pin (EN)

The part is enabled through the  $\overline{\text{EN}}$  pin. In some diagrams and figures, ENB refers to  $\overline{\text{EN}}$ . A high level on this pin allows forcing off the internal switch and drastically decreases the current consumption of the NCP398 core. To exit the OFF state, the  $\overline{\text{EN}}$  pin must be tied low.

#### Under-voltage Lockout (UVLO)

To ensure proper operation under any conditions, the device integrates an under-voltage lock out (UVLO) comparator. This block has a built-in hysteresis to provide noise immunity to transient conditions.

#### Over-voltage Lockout (OVLO)

To protect connected systems on  $V_{OUT}$  pin from over-voltage, a second comparator, over-voltage lock out (OVLO), is embedded. During over-voltage condition, the output remains disabled until the input voltage drops below the OVLO – comparator hysteresis.

#### Auto Discharge – R<sub>PD</sub>

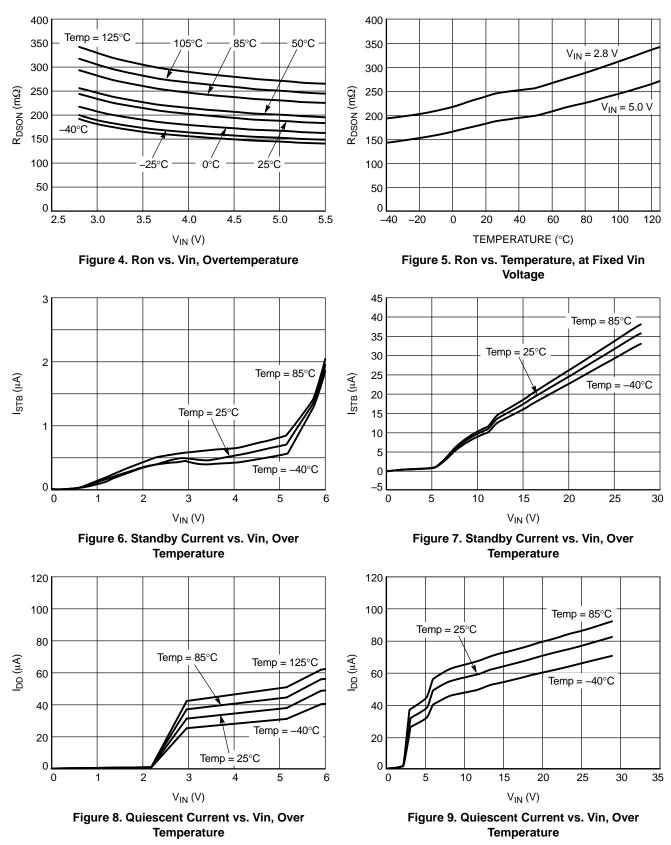

When disabling the NCP398 the output gets automatically discharged by means of the internal pull down resistor Rpd. Once reaching the Vpd level the discharge path is disabled. The auto–discharge is also engaged when Vin drops below the UVLO threshold. The auto–discharge ensures a proper power cycling of peripherals connected to the output of the NCP398.

#### **Thermal Shutdown Protection**

In case of internal overheating, the integrated thermal shutdown (TSD) protection will open the internal NMOS FET in order to instantaneously decrease the device temperature.

Embedded hysteresis allows reengaging the NMOS FET when the junction temperature decreases.

This OFF–ON cycle is repeated until the fault event disappears.
