

# nRF52833

## Product Specification

v1.3

# Feature list

## Features:

- **Bluetooth<sup>®</sup> 5.1**, IEEE 802.15.4-2006, 2.4 GHz transceiver
  - -96 dBm sensitivity in 1 Mbps **Bluetooth<sup>®</sup>** low energy mode
  - -103 dBm sensitivity in 125 kbps **Bluetooth<sup>®</sup>** low energy mode (long range)
  - -20 to +8 dBm TX power, configurable in 4 dB steps
  - On-air compatible with nRF52, nRF51, nRF24L, and nRF24AP Series
  - Supported data rates:
    - **Bluetooth<sup>®</sup>** 5.1 – 2 Mbps, 1 Mbps, 500 kbps, and 125 kbps
    - IEEE 802.15.4-2006 – 250 kbps
    - Proprietary 2.4 GHz – 2 Mbps, 1 Mbps
  - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using **Bluetooth<sup>®</sup>**
  - Single-ended antenna output (on-chip balun)
  - 128-bit AES/ECB/CCM/AAR co-processor (on-the-fly packet encryption)
  - 4.9 mA peak current in TX (0 dBm)
  - 4.6 mA peak current in RX
  - RSSI (1 dB resolution)
- **ARM<sup>®</sup> Cortex<sup>®</sup> -M4** 32-bit processor with FPU, 64 MHz
  - 217 EEMBC CoreMark<sup>®</sup> score running from flash memory
  - 52  $\mu$ A/MHz running CoreMark from flash memory
  - 38  $\mu$ A/MHz running CoreMark from RAM
  - Watchpoint and trace debug modules (DWT, ETM, and ITM)
  - Serial wire debug (SWD)
- Rich set of security features
  - Secure boot ready
    - Flash access control list (ACL)
    - Debug control and configuration
    - Access port protection (CTRL-AP)
  - Secure erase
- Flexible power management
  - 1.7 V to 5.5 V supply voltage range
  - On-chip DC/DC and LDO regulators with automated low current modes
  - Automated peripheral power management
  - Fast wake-up using 64 MHz internal oscillator
  - 0.6  $\mu$ A at 3 V in System OFF mode, no RAM retention
  - 1.5  $\mu$ A at 3 V in System ON mode, no RAM retention, wake on RTC
- 512 kB flash and 128 kB RAM
- Advanced on-chip interfaces
  - USB 2.0 full speed (12 Mbps) controller
  - High-speed 32 MHz SPI
  - Type 2 near field communication (NFC-A) tag with wake-on field
    - Touch-to-pair support
  - Programmable peripheral interconnect (PPI)
  - 42 general purpose I/O pins
  - EasyDMA automated data transfer between memory and peripherals
- Nordic SoftDevice ready with support for concurrent multiprotocol
- 12-bit, 200 ksp/s ADC – 8 configurable channels with programmable gain
- 64 level comparator
- 15 level low-power comparator with wake-up from System OFF mode
- Temperature sensor
- 4x four channel pulse width modulator (PWM) unit with EasyDMA
- Audio peripherals – I<sup>2</sup>S, digital microphone interface (PDM)
- 5x 32-bit timer with counter mode
- Up to 4x SPI master/3x SPI slave with EasyDMA
- Up to 2x I<sup>2</sup>C compatible two-wire master/slave
- 2x UART (CTS/RTS) with EasyDMA
- Quadrature decoder (QDEC)
- 3x real-time counter (RTC)
- Single crystal operation
- Operating temperature from -40 to 105 °C
- Package variants
  - aQFN<sup>™</sup> 73 package, 7 x 7 mm
  - QFN40 package, 5 x 5 mm
  - WLCSP package, 3.175 x 3.175 mm

**Applications:**

- Advanced computer peripherals and I/O devices
  - Mouse
  - Keyboard
  - Multi-touch trackpad
- Advanced wearables
  - Health/fitness sensor and monitor devices
  - Wireless payment enabled devices
- Internet of things (IoT)
  - Smart home sensors and controllers
  - Industrial IoT sensors and controllers
- Interactive entertainment devices
  - Remote controls
  - Gaming controllers

| 5.3.7 Registers . . . . .  | 68        |
| 5.3.8 Electrical specification . . . . .   | 78        |
| 5.4 CLOCK — Clock control . . . . .  | 80        |
| 5.4.1 HFCLK controller . . . . .   | 80        |
| 5.4.2 LFCLK controller . . . . .   | 82        |
| 5.4.3 Registers . . . . .  | 85        |
| 5.4.4 Electrical specification . . . . .   | 93        |
| <b>6 Peripherals. . . . .</b>  | <b>96</b> |
| 6.1 Peripheral interface . . . . .   | 96        |
| 6.1.1 Peripheral ID . . . . .  | 96        |
| 6.1.2 Peripherals with shared ID . . . . .   | 97        |
| 6.1.3 Peripheral registers . . . . .   | 97        |
| 6.1.4 Bit set and clear . . . . .  | 97        |
| 6.1.5 Tasks . . . . .  | 97        |
| 6.1.6 Events . . . . .   | 97        |
| 6.1.7 Shortcuts . . . . .  | 98        |
| 6.1.8 Interrupts . . . . .   | 98        |
| 6.2 AAR — Accelerated address resolver . . . . .   | 99        |
| 6.2.1 EasyDMA . . . . .  | 99        |
| 6.2.2 Resolving a resolvable address . . . . .   | 99        |
| 6.2.3 Use case example for chaining RADIO packet reception with address resolution using AAR . . . . . | 100       |
| 6.2.4 IRK data structure . . . . .   | 100       |
| 6.2.5 Registers . . . . .  | 100       |
| 6.2.6 Electrical specification . . . . .   | 104       |
| 6.3 ACL — Access control lists . . . . .   | 104       |
| 6.3.1 Registers . . . . .  | 106       |
| 6.4 CCM — AES CCM mode encryption . . . . .  | 108       |
| 6.4.1 Key-stream generation . . . . .  | 108       |
| 6.4.2 Encryption . . . . .   | 109       |
| 6.4.3 Decryption . . . . .   | 109       |
| 6.4.4 AES CCM and RADIO concurrent operation . . . . .   | 110       |
| 6.4.5 Encrypting packets on-the-fly in radio transmit mode . . . . .                                   | 110       |
| 6.4.6 Decrypting packets on-the-fly in radio receive mode . . . . .                                    | 111       |
| 6.4.7 CCM data structure . . . . .   | 112       |
| 6.4.8 EasyDMA and ERROR event . . . . .  | 113       |
| 6.4.9 Registers . . . . .  | 113       |
| 6.4.10 Electrical specification . . . . .  | 120       |
| 6.5 COMP — Comparator . . . . .  | 120       |
| 6.5.1 Differential mode . . . . .  | 122       |

|   |     |
|---|-----|
| 6.5.2 Single-ended mode . . . . .                           | 122 |
| 6.5.3 Registers . . . . .                                   | 124 |
| 6.5.4 Electrical specification . . . . .                    | 131 |
| 6.6 ECB — AES electronic codebook mode encryption . . . . . | 132 |
| 6.6.1 Shared resources . . . . .                            | 132 |
| 6.6.2 EasyDMA . . . . .                                     | 132 |
| 6.6.3 ECB data structure . . . . .                          | 132 |
| 6.6.4 Registers . . . . .                                   | 133 |
| 6.6.5 Electrical specification . . . . .                    | 135 |
| 6.7 EGU — Event generator unit . . . . .                    | 135 |
| 6.7.1 Registers . . . . .                                   | 136 |
| 6.7.2 Electrical specification . . . . .                    | 138 |
| 6.8 GPIO — General purpose input/output . . . . .           | 138 |
| 6.8.1 Pin configuration . . . . .                           | 139 |
| 6.8.2 Registers . . . . .                                   | 141 |
| 6.8.3 Electrical specification . . . . .                    | 145 |
| 6.9 GPIOTE — GPIO tasks and events . . . . .                | 146 |
| 6.9.1 Pin events and tasks . . . . .                        | 147 |
| 6.9.2 Port event . . . . .                                  | 147 |
| 6.9.3 Tasks and events pin configuration . . . . .          | 148 |
| 6.9.4 Registers . . . . .                                   | 148 |
| 6.9.5 Electrical specification . . . . .                    | 152 |
| 6.10 I <sup>2</sup> S — Inter-IC sound interface . . . . .  | 152 |
| 6.10.1 Mode . . . . .                                       | 153 |
| 6.10.2 Transmitting and receiving . . . . .                 | 153 |
| 6.10.3 Left right clock (LRCK) . . . . .                    | 154 |
| 6.10.4 Serial clock (SCK) . . . . .                         | 154 |
| 6.10.5 Master clock (MCK) . . . . .                         | 155 |
| 6.10.6 Width, alignment and format . . . . .                | 155 |
| 6.10.7 EasyDMA . . . . .                                    | 157 |
| 6.10.8 Module operation . . . . .                           | 159 |
| 6.10.9 Pin configuration . . . . .                          | 161 |
| 6.10.10 Registers . . . . .                                 | 162 |
| 6.10.11 Electrical specification . . . . .                  | 171 |
| 6.11 LPCOMP — Low-power comparator . . . . .                | 172 |

| November 2019 | 1.0     | First release  |

# 2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC.

## 2.1 Document status

The document status reflects the level of maturity of the document.

| Document name                         | Description  |
|---------------------------------------|--|
| Objective Product Specification (OPS) | Applies to document versions up to 1.0.<br><br>This document contains target specifications for product development.   |
| Product Specification (PS)            | Applies to document versions 1.0 and higher.<br><br>This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

Table 1: Defined document names

## 2.2 Peripheral chapters

Every peripheral has a unique capitalized name or an abbreviation of its name, e.g. TIMER, used for identification and reference. This name is used in chapter headings and references, and it will appear in the ARM<sup>®</sup> Cortex<sup>®</sup> Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

The peripheral instance name, which is different from the peripheral name, is constructed using the peripheral name followed by a numbered postfix, starting with 0, for example, TIMER0. A postfix is normally only used if a peripheral can be instantiated more than once. The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

The chapters describing peripherals may include the following information:

- A detailed functional description of the peripheral
- Register configuration for the peripheral
- Electrical specification tables, containing performance data which apply for the operating conditions described in [Recommended operating conditions](#) on page 608.

## 2.3 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

### 2.3.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value Id** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value Id** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value Id**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..!'.  
 ..!

A feature marked **Deprecated** should not be used for new designs.

### 2.3.2 Permissions

Different fields in a register might have different access permissions enforced by hardware.

The access permission for each register field is documented in the **Access** column in the following ways:

| Access | Description     | Hardware behavior  |
|--------|-----------------|--|
| RO     | Read-only       | Field can only be read. A write will be ignored.   |
| WO     | Write-only      | Field can only be written. A read will return an undefined value.  |
| RW     | Read-write      | Field can be read and written multiple times.  |
| W1     | Write-once      | Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value. |
| RW1    | Read-write-once | Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.               |

Table 2: Register field permission schemes

## 2.4 Registers

| Register | Offset | Description                                       |
|----------|--------|---|
| DUMMY    | 0x514  | Example of a register controlling a dummy feature |

Table 3: Register overview

### 2.4.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

|-------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| Bit number              | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
| ID                      |    |    |    |    | D  | D  | D  | D  |    |    |    |    | C  | C  | C  |    |    |    |    | B  |    |    |   |   | A | A |   |   |   |   |   |   |   |
| <b>Reset 0x00050002</b> | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| ID | Acce | Field   | Value ID     | Value  | Description  |
|----|------|---------|--------------|--------|--|
| A  | RW   | FIELD_A |              |        | Example of a read-write field with several enumerated values                           |
|    |      |         | Disabled     | 0      | The example feature is disabled  |
|    |      |         | NormalMode   | 1      | The example feature is enabled in normal mode  |
|    |      |         | ExtendedMode | 2      | The example feature is enabled along with extra functionality                          |
| B  | RW   | FIELD_B |              |        | Example of a deprecated read-write field <span style="float: right;">Deprecated</span> |
|    |      |         | Disabled     | 0      | The override feature is disabled   |
|    |      |         | Enabled      | 1      | The override feature is enabled  |
| C  | RW   | FIELD_C |              |        | Example of a read-write field with a valid range of values                             |
|    |      |         | ValidRange   | [2..7] | Example of allowed values for this field   |
| D  | RW   | FIELD_D |              |        | Example of a read-write field with no restriction on the values                        |

# 3 Block diagram

This block diagram illustrates the overall system. Arrows with white heads indicate signals that share physical pins with other signals.

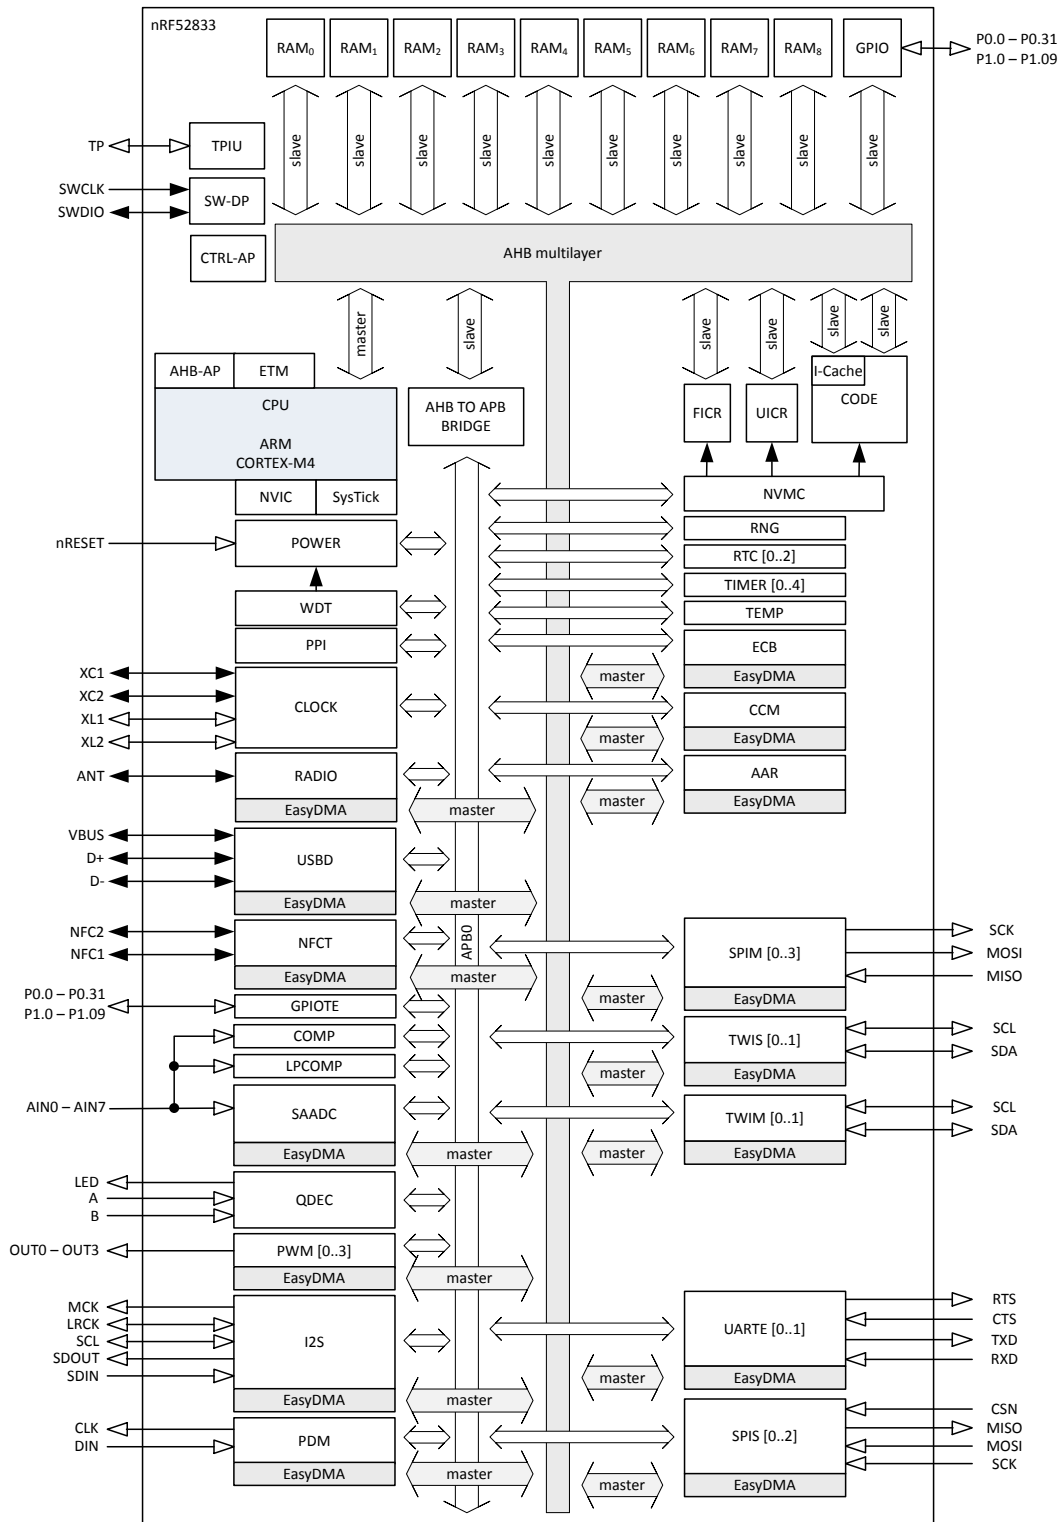

Figure 1: Block diagram

# 4 Core components

## 4.1 CPU

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 processor with floating-point unit (FPU) has a 32-bit instruction set (Thumb<sup>®</sup>-2 technology) that implements a superset of 16- and 32-bit instructions to maximize code density and performance.

This processor implements the following features that enable energy-efficient arithmetic and high-performance signal processing.

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)

The ARM<sup>®</sup> Cortex<sup>®</sup> Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer for the ARM<sup>®</sup> Cortex<sup>®</sup> processor series is implemented and available for the M4 CPU.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the nested vectored interrupt controller (NVIC).

Executing code from flash memory will have a wait state penalty on the nRF52 Series. An instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [Cache](#) on page 25. The [Electrical specification](#) on page 19 shows CPU performance parameters including wait states in different modes, CPU current and efficiency, and processing power and efficiency based on the CoreMark<sup>®</sup> benchmark.

The ARM system timer (SysTick) is present on nRF52833. The SysTick's clock will only tick when the CPU is running or when the system is in debug interface mode.

### 4.1.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions when used due to e.g. overflow or underflow, which in turn will trigger the FPU interrupt.

See [Instantiation](#) on page 22 for more information about the exceptions triggering the FPU interrupt.

To clear the IRQ (interrupt request) line when an exception has occurred, the relevant exception bit within the floating-point status and control register (FPSCR) needs to be cleared. For more information about the FPSCR or other FPU registers, see [Cortex-M4 Devices Generic User Guide](#).

### 4.1.2 CPU and support module configuration

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 processor has a number of CPU options and support modules implemented on the IC.

| Option / Module | Description                        | Implemented   |
|-----------------|------------------------------------|---------------|
| Core options    |                                    |               |
| NVIC            | Nested vector interrupt controller | 48 vectors    |
| PRIORITIES      | Priority bits                      | 3             |
| WIC             | Wakeup interrupt controller        | NO            |
| Endianness      | Memory system endianness           | Little endian |
| Bit-banding     | Bit banded memory                  | NO            |
| DWT             | Data watchpoint and trace          | YES           |
| SysTick         | System tick timer                  | YES           |
| Modules         |                                    |               |
| MPU             | Memory protection unit             | YES           |
| FPU             | Floating-point unit                | YES           |
| DAP             | Debug access port                  | YES           |
| ETM             | Embedded trace macrocell           | YES           |
| ITM             | Instrumentation trace macrocell    | YES           |
| TPIU            | Trace port interface unit          | YES           |
| ETB             | Embedded trace buffer              | NO            |
| FPB             | Flash patch and breakpoint unit    | YES           |
| HTM             | AMBA™ AHB trace macrocell          | NO            |

## 4.1.3 Electrical specification

### 4.1.3.1 CPU performance

The CPU clock speed is 64 MHz. Current and efficiency data is taken when in System ON and the CPU is executing the CoreMark® benchmark. It includes power regulator and clock base currents. All other blocks are IDLE.

| Symbol                  | Description  | Min. | Typ. | Max. | Units                   |
|-------------------------|--|------|------|------|-------------------------|
| W <sub>FLASH</sub>      | CPU wait states, running CoreMark from flash, cache disabled         |      |      | 2    |                         |
| W <sub>FLASHCACHE</sub> | CPU wait states, running CoreMark from flash, cache enabled          |      |      | 3    |                         |
| W <sub>RAM</sub>        | CPU wait states, running CoreMark from RAM                           |      |      | 0    |                         |
| CM <sub>FLASH</sub>     | CoreMark, running CoreMark from flash, cache enabled                 |      | 217  |      | Core <sup>l</sup>       |
| CM <sub>FLASH/MHz</sub> | CoreMark per MHz, running CoreMark from flash, cache enabled         |      | 3.4  |      | CoreMark/<br>MHz        |
| CM <sub>FLASH/mA</sub>  | CoreMark per mA, running CoreMark from flash, cache enabled, DCDC 3V |      | 65.8 |      | Core <sup>l</sup><br>mA |

## 4.2 Memory

The nRF52833 contains 512 kB of flash memory and 128 kB of RAM that can be used for code and data storage.

The CPU and peripherals with EasyDMA can access memory via the AHB multilayer interconnect. In addition, peripherals are accessed by the CPU via the AHB multilayer interconnect, as shown in the following figure.

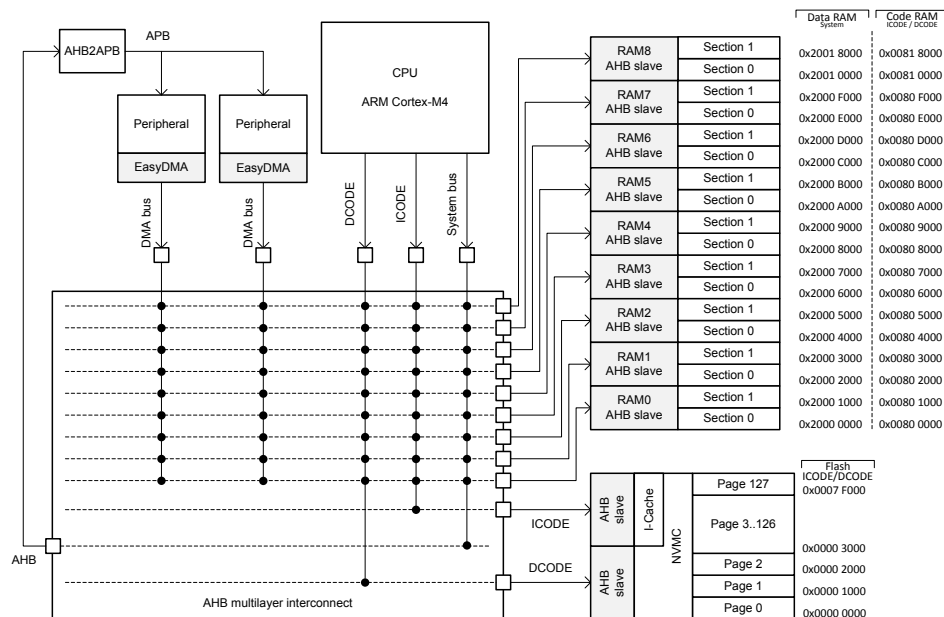

Figure 2: Memory layout

See [AHB multilayer](#) on page 46 and [EasyDMA](#) on page 44 for more information about the AHB multilayer interconnect and EasyDMA.

The same physical RAM is mapped to both the Data RAM region and the Code RAM region. It is up to the application to partition the RAM within these regions so that one does not corrupt the other.

### 4.2.1 RAM - Random access memory

The RAM interface is divided into nine RAM AHB slaves.

RAM AHB slaves 0 to 7 are connected to two 4 kB RAM sections each, while RAM AHB slave 8 is connected to two 32 kB sections, as shown in [Memory layout](#) on page 20.

Each RAM section has separate power control for System ON and System OFF mode operation, which is configured via RAM register (see the [POWER — Power supply](#) on page 58).

### 4.2.2 Flash - Non-volatile memory

The CPU can read from flash memory an unlimited number of times, but is restricted in how it writes to flash and the number of writes and erases it can perform.

Writing to flash memory is managed by the non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 23.

Flash memory is divided into 128 pages of 4 kB each that can be accessed by the CPU via the ICODE and DCODE buses as shown in [Memory layout](#) on page 20.

### 4.2.3 Memory map

The complete memory map for the nRF52833 is shown in the following figure. As described in [Memory](#) on page 19, Code RAM and Data RAM are the same physical RAM.

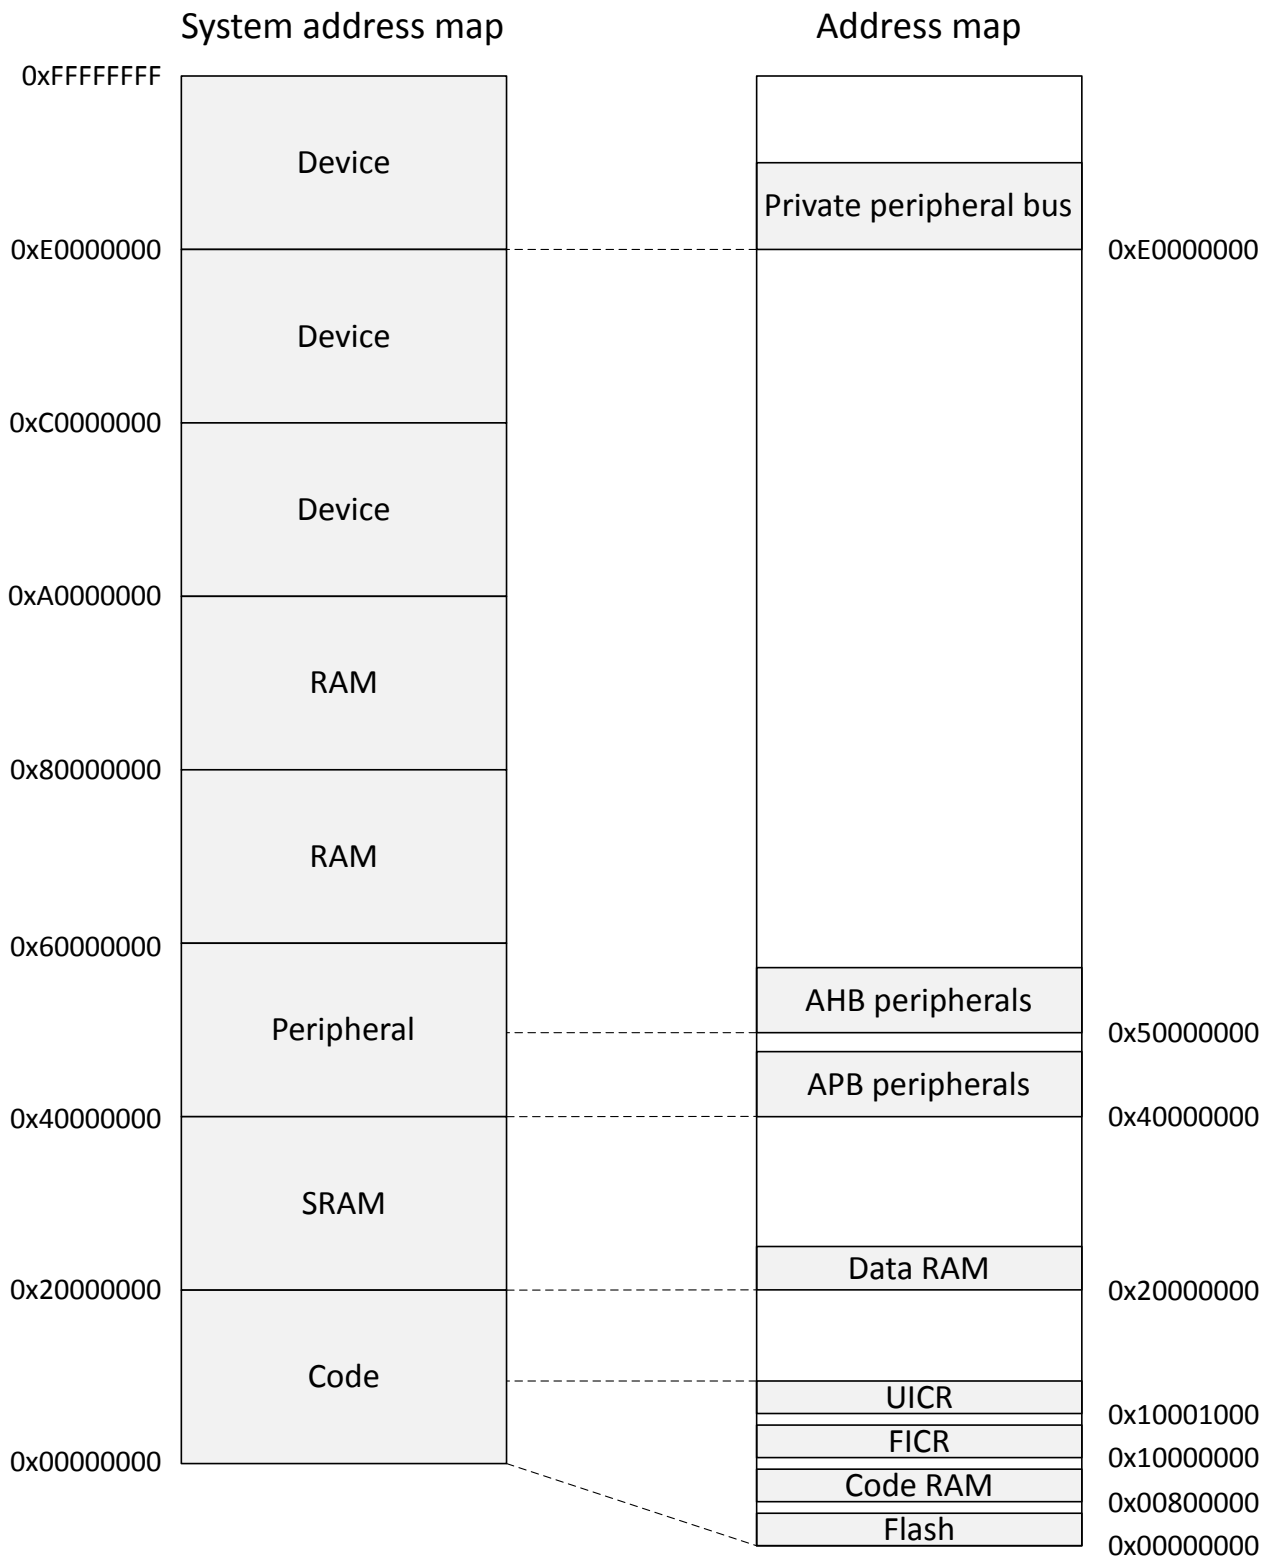

Figure 3: Memory map

## 4.2.4 Instantiation

| ID | Base address | Peripheral | Instance | Description  |            |
|----|--------------|------------|----------|--|------------|
| 0  | 0x40000000   | CLOCK      | CLOCK    | Clock control  |            |
| 0  | 0x40000000   | POWER      | POWER    | Power control  |            |
| 0  | 0x50000000   | GPIO       | GPIO     | General purpose input and output                                 | Deprecated |
| 0  | 0x50000000   | GPIO       | P0       | General purpose input and output, port 0                         |            |
| 0  | 0x50000300   | GPIO       | P1       | General purpose input and output, port 1                         |            |
| 1  | 0x40001000   | RADIO      | RADIO    | 2.4 GHz radio  |            |
| 2  | 0x40002000   | UART       | UART0    | Universal asynchronous receiver/transmitter                      | Deprecated |
| 2  | 0x40002000   | UARTE      | UARTE0   | Universal asynchronous receiver/transmitter with EasyDMA, unit 0 |            |
| 3  | 0x40003000   | SPI        | SPIO     | SPI master 0   | Deprecated |
| 3  | 0x40003000   | SPIM       | SPIM0    | SPI master 0   |            |
| 3  | 0x40003000   | SPIS       | SPIS0    | SPI slave 0  |            |
| 3  | 0x40003000   | TWI        | TWI0     | Two-wire interface master 0                                      | Deprecated |
| 3  | 0x40003000   | TWIM       | TWIM0    | Two-wire interface master 0                                      |            |
| 3  | 0x40003000   | TWIS       | TWIS0    | Two-wire interface slave 0                                       |            |
| 4  | 0x40004000   | SPI        | SPI1     | SPI master 1   | Deprecated |
| 4  | 0x40004000   | SPIM       | SPIM1    | SPI master 1   |            |
| 4  | 0x40004000   | SPIS       | SPIS1    | SPI slave 1  |            |
| 4  | 0x40004000   | TWI        | TWI1     | Two-wire interface master 1                                      | Deprecated |
| 4  | 0x40004000   | TWIM       | TWIM1    | Two-wire interface master 1                                      |            |
| 4  | 0x40004000   | TWIS       | TWIS1    | Two-wire interface slave 1                                       |            |

Table 4: Instantiation table

## 4.3 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the UICR (user information configuration registers).

The `CONFIG` on page 26 is used to enable the NVMC for writing (`CONFIG.WEN = Wen`) and erasing (`CONFIG.WEN = Een`).

The CPU must be halted before initiating a NVMC operation from the debug system.

### 4.3.1 Writing to flash

When write is enabled, full 32-bit words can be written to word-aligned addresses in flash memory.

As illustrated in [Memory](#) on page 19, the flash is divided into multiple pages. The same 32-bit word in flash memory can only be written  $n_{WRITE}$  number of times before a page erase must be performed.

The NVMC is only able to write 0 to bits in flash memory that are erased (set to 1). It cannot rewrite a bit back to 1. Only full 32-bit words can be written to flash memory using the NVMC interface. To write less than 32 bits, write the data as a full 32-bit word and set all the bits that should remain unchanged in the word to 1. The restriction on the number of writes ( $n_{WRITE}$ ) still applies in this case.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a hard fault.

The time it takes to write a word to flash is specified by  $t_{WRITE}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the flash.

NVM writing time can be reduced by using `READYNEXT`. If this status bit is set to 1, code can perform the next data write to the flash. This write will be buffered and will be taken into account as soon as the ongoing write operation is completed.

### 4.3.2 Erasing a page in flash

When erase is enabled, the flash memory can be erased page by page using the [ERASEPAGE](#) on page 27.

After erasing a flash page, all bits in the page are set to 1. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the flash.

See [Partial erase of a page in flash](#) on page 25 for information on dividing the page erase time into shorter chunks.

### 4.3.3 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR can only be written  $n_{\text{WRITE}}$  number of times before an erase must be performed using [ERASEUICR](#) on page 28 or [ERASEALL](#) on page 27. The time it takes to write a word to UICR is specified by  $t_{\text{WRITE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC is writing to the UICR.

### 4.3.4 Erasing user information configuration registers (UICR)

When erase is enabled, UICR can be erased using the [ERASEUICR](#) on page 28.

After erasing UICR, all bits in UICR are set to 1. The time it takes to erase UICR is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

### 4.3.5 Erase all

When erase is enabled, flash and UICR can be erased completely in one operation by using the [ERASEALL](#) on page 27. This operation will not erase the factory information configuration registers (FICR).

The time it takes to perform an [ERASEALL](#) command is specified by  $t_{\text{ERASEALL}}$ . The CPU is halted if the CPU executes code from the flash while the NVMC performs the erase operation.

### 4.3.6 Access port protection behavior

When access port protection is enabled, parts of the NVMC functionality will be blocked in order to prevent intentional or unintentional erase of UICR.

|                  | CTRL-AP | ERASEALL | NVMC ERASEPAGE | NVMC ERASEPAGE<br>PARTIAL | NVMC ERASEALL | NVMC ERASEUICR |
|------------------|---------|----------|----------------|---------------------------|---------------|----------------|
| <b>APPROTECT</b> |         |          |                |                           |               |                |
| Disabled         | Allowed | Allowed  | Allowed        | Allowed                   | Allowed       | Allowed        |
| Enabled          | Allowed | Allowed  | Allowed        | Allowed                   | Allowed       | Blocked        |

Table 5: NVMC Protection

### 4.3.7 NVMC power failure protection

NVMC power failure protection is possible through use of power-fail comparator that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below  $V_{\text{POF}}$  threshold, the power-fail comparator will prevent the NVMC from performing erase or write operations in non-volatile memory (NVM).

If a power failure warning is present at the start of an NVM erase operation, the NVMC operation will be ignored.

If a power failure warning is present at the start of an NVM write operation, the CPU will hardfault.

### 4.3.8 Partial erase of a page in flash

Partial erase is a feature in the NVMC to split a page erase time into shorter chunks to prevent longer CPU stalls in time-critical applications. Partial erase is only applicable to the code area in flash memory and does not work with UICR.

When erase is enabled, the partial erase of a flash page can be started by writing to [ERASEPAGEPARTIAL](#) on page 28. The duration of a partial erase can be configured in [ERASEPAGEPARTIALCFG](#) on page 28. A flash page is erased when its erase time reaches  $t_{ERASEPAGE}$ . Use [ERASEPAGEPARTIAL](#) N number of times so that  $N * ERASEPAGEPARTIALCFG \geq t_{ERASEPAGE}$ , where  $N * ERASEPAGEPARTIALCFG$  gives the cumulative (total) erase time. Every time the cumulative erase time reaches  $t_{ERASEPAGE}$ , it counts as one erase cycle.

After the erase is complete, all bits in the page are set to 1. The CPU is halted if the CPU executes code from the flash while the NVMC performs the partial erase operation.

The bits in the page are undefined if the flash page erase is incomplete, i.e. if a partial erase has started but the total erase time is less than  $t_{ERASEPAGE}$ .

### 4.3.9 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from flash, is shown in [CPU](#) on page 18.

Enabling the cache can increase CPU performance and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache will use some current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will decrease.

When disabled, the cache does not use current and does not retain its content.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the [ICACHECNF](#) register. When profiling is enabled, the [IHIT](#) and [IMISS](#) registers are incremented for every instruction cache hit or miss, respectively. The hit and miss profiling registers do not wrap around after reaching the maximum value. If the maximum value is reached, consider profiling for a shorter duration to get correct numbers.

### 4.3.10 Registers

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x4001E000   | NVMC       | NVMC     | Non-volatile memory controller |               |

## 4.3.11 Electrical specification

### 4.3.11.1 Flash programming

| Symbol                     | Description  | Min.  | Typ. | Max.              | Units |
|----------------------------|--|-------|------|-------------------|-------|
| $n_{WRITE}$                | Number of times a 32-bit word can be written before erase  |       |      | 2                 |       |
| $n_{ENDURANCE}$            | Erase cycles per page  | 10000 |      |                   |       |
| $t_{WRITE}$                | Time to write one 32-bit word  |       |      | 42.5 <sup>1</sup> | µs    |
| $t_{ERASEPAGE}$            | Time to erase one page   |       |      | 87.5 <sup>1</sup> | ms    |
| $t_{ERASEALL}$             | Time to erase all flash  |       |      | 173 <sup>1</sup>  | ms    |
| $t_{ERASEPAGEPARTIAL,acc}$ | Accuracy of the partial page erase duration. Total execution time for one partial page erase is defined as<br>$ERASEPAGEPARTIALCFG * t_{ERASEPAGEPARTIAL,acc}$ |       |      | 1.09 <sup>1</sup> |       |

### 4.3.11.2 Cache size

| Symbol                           | Description       | Min. | Typ. | Max. | Units |
|----------------------------------|-------------------|------|------|------|-------|
| Size <sub>I<sub>CODE</sub></sub> | I-Code cache size |      | 2048 |      | Bytes |

## 4.4 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

### 4.4.1 Registers

| Base address | Peripheral | Instance | Description                       | Configuration |
|--------------|------------|----------|-----------------------------------|---------------|
| 0x10000000   | FICR       | FICR     | Factory information configuration |               |

Table 8: Instances

| Register       | Offset | Description             |
|----------------|--------|-------------------------|
| CODEPAGESIZE   | 0x010  | Code memory page size   |
| CODESIZE       | 0x014  | Code memory size        |
| DEVICEID[0]    | 0x060  | Device identifier       |
| DEVICEID[1]    | 0x064  | Device identifier       |
| ER[0]          | 0x080  | Encryption root, word 0 |
| ER[1]          | 0x084  | Encryption root, word 1 |

## 4.5 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user-specific settings.

For information on writing UICR registers, see the [NVMC — Non-volatile memory controller](#) on page 23 and [Memory](#) on page 19 chapters.

### 4.5.1 Registers

| Base address | Peripheral | Instance | Description                    | Configuration |
|--------------|------------|----------|--------------------------------|---------------|
| 0x10001000   | UICR       | UICR     | User information configuration |               |

Table 10: Instances

| Register    | Offset | Description                         |
|-------------|--------|-------------------------------------|
| UNUSED0     | 0x000  | Reserved                            |

### 4.5.1.4 PSELRESET[n] (n=0..1)

Address offset: 0x200 + (n × 0x4)

Mapping of the nRESET function (see POWER chapter for details)

All PSELRESET registers have to contain the same value for a pin mapping to be valid. If values are not the same, there will be no nRESET function exposed on a GPIO. As a result, the device will always start independently of the levels present on any of the GPIOs.

## 4.6 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA is not able to access flash.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in [EasyDMA example](#) on page 44.

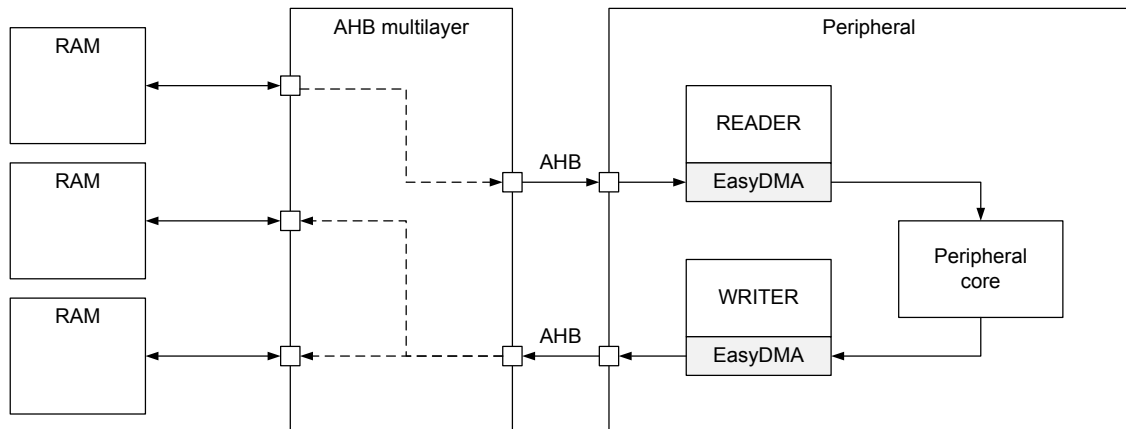

Figure 4: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will perform the following tasks:

- Read 5 bytes from the readerBuffer located in RAM at address 0x20000000
- Process the data
- Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005

The memory layout of these buffers is illustrated in [EasyDMA memory layout](#) on page 45.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

Figure 5: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

**Note:** The PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 19 for more information about the different memory regions and EasyDMA connectivity.

### 4.6.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

### 4.6.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure `ArrayList_type` as illustrated in the code example below using a `READER` EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of `READER.MAXCNT` register. EasyDMA uses the `READER.MAXCNT` register to determine when the buffer is full.

Figure 6: EasyDMA array list

## 4.7 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to all the slave devices using an interconnection matrix. The bus masters are assigned priorities, which are used to resolve access when two (or more) bus masters request access to the same slave device. When that occurs, the following rules apply:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted the access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, thus cannot be used concurrently.

Some peripherals, such as `RADIO`, do not have a safe stalling mechanism (no internal data buffering, or opportunity to pause incoming data). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, follow these guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

Below is a list of bus masters in the system and their priorities.

| Bus master name         | Description                          |
|-------------------------|--------------------------------------|
| CPU                     |                                      |
| CTRL-AP                 |                                      |
| USB                     |                                      |
| SPIM1/SPIS1/TWIM1/TWIS1 | Same priority and mutually exclusive |
| RADIO                   |                                      |
| CCM/ECB/AAR             | Same priority and mutually exclusive |
| SAADC                   |                                      |
| UARTE0                  |                                      |
| SPIM0/SPIS0/TWIM0/TWIS0 | Same priority and mutually exclusive |
| SPIM2/SPIS2             | Same priority and mutually exclusive |
| NFCT                    |                                      |
| I2S                     |                                      |
| PDM                     |                                      |
| PWM0                    |                                      |
| PWM1                    |                                      |
| PWM2                    |                                      |
| PWM3                    |                                      |
| UARTE1                  |                                      |
| SPIM3                   |                                      |

Table 12: AHB bus masters (listed from highest to lowest priority)

Defined bus masters are the CPU and peripherals with implemented EasyDMA. The available slaves are RAM AHB slaves. How the bus masters and slaves are connected using the interconnection matrix is illustrated in [Memory](#) on page 19.

## 4.8 Debug and trace

Debug and trace system offers a flexible and powerful mechanism for non-intrusive debugging.

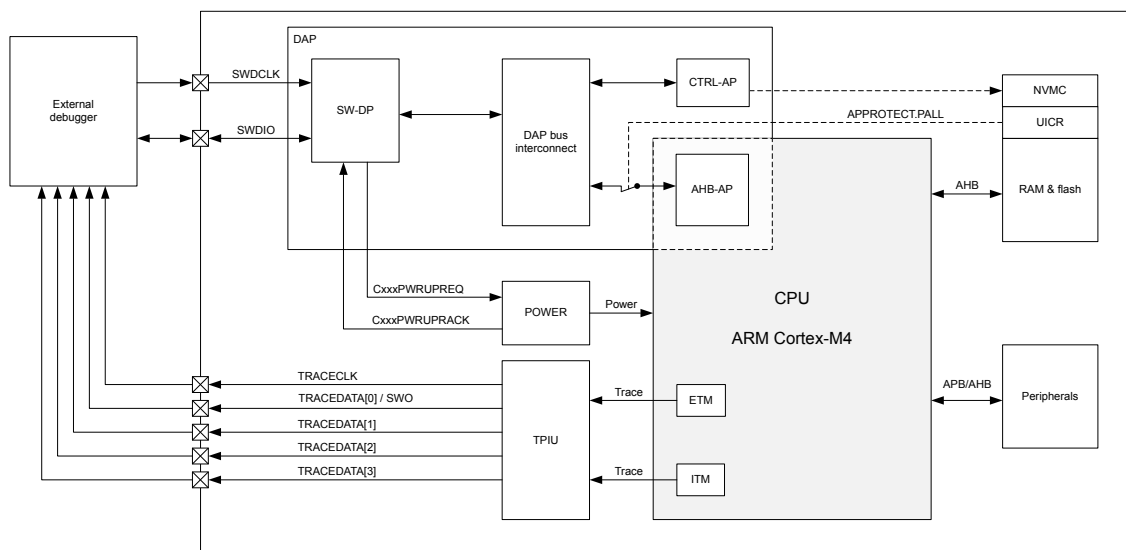

Figure 7: Debug and trace overview

The main features of the debug and trace system are the following:

- Two-pin serial wire debug (SWD) interface
- Flash patch and breakpoint (FPB) unit that supports:
  - Two literal comparators
  - Six instruction comparators
- Data watchpoint and trace (DWT) unit with four comparators
- Instrumentation trace macrocell (ITM)
- Embedded trace macrocell (ETM)
- Trace port interface unit (TPIU)
  - 4-bit parallel trace of ITM and ETM trace data
  - Serial wire output (SWO) trace of ITM data

### 4.8.1 DAP - Debug access port

An external debugger can access the device via the DAP.

The debug access port (DAP) implements a standard ARM® CoreSight™ serial wire debug port (SW-DP), which implements the serial wire debug protocol (SWD). SWD is a two-pin serial interface, see SWDCLK and SWDIO in [Debug and trace overview](#) on page 47.

In addition to the default access port in CPU (AHB-AP), the DAP includes a custom control access port (CTRL-AP). The CTRL-AP is described in more detail in [CTRL-AP - Control access port](#) on page 48.

#### Note:

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

### 4.8.2 CTRL-AP - Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other access ports in the DAP are disabled by the access port protection.

Access port protection blocks the debugger from read and write access to all CPU registers and memory-mapped addresses. See the UICR register [APPROTECT](#) on page 42 for more information on enabling access port protection.

Control access port has the following features:

- Soft reset, see [Reset](#) on page 67 for more information
- Disabling of access port protection, which is the reason why CTRL-AP allows control of the device even when all other access ports in the DAP are disabled by the access port protection

Access port protection is disabled by issuing an ERASEALL command via CTRL-AP. This command will erase the flash, UICR, and RAM.

## 4.8.2.1 Registers

| Register        | Offset | Description                                |
|-----------------|--------|--|
| RESET           | 0x000  | Soft reset triggered through CTRL-AP       |
| ERASEALL        | 0x004  | Erase all                                  |
| ERASEALLSTATUS  | 0x008  | Status register for the ERASEALL operation |
| APPROTECTSTATUS | 0x00C  | Status register for access port protection |
| IDR             | 0x0FC  | CTRL-AP identification register, IDR       |

Table 13: Register overview

### 4.8.2.1.1 RESET

Address offset: 0x000

Soft reset triggered through CTRL-AP

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |       |          |       |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|------------------|---|-------|----------|-------|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|

### 4.8.2.2 Electrical specification

#### 4.8.2.2.1 Control access port

| Symbol       | Description                                       | Min.  | Typ. | Max. | Units      |
|--------------|---|-------|------|------|------------|
| $R_{pull}$   | Internal SWDIO and SWDCLK pull up/down resistance |       | 13   |      | k $\Omega$ |
| $f_{SWDCLK}$ | SWDCLK frequency                                  | 0.125 |      | 8    | MHz        |

### 4.8.3 Debug interface mode

Before an external debugger can access either CPU's access port (AHB-AP) or the control access port (CTRL-AP), the debugger must first request the device to power up via CxxxPWRUPREQ in the SWJ-DP.

If the device is in System OFF when power is requested via CxxxPWRUPREQ, the system will wake up and the DIF flag in [RESETREAS](#) on page 73 will be set. The device is in the debug interface mode as long as the debugger is requesting power via CxxxPWRUPREQ. Once the debugger stops requesting power via CxxxPWRUPREQ, the device is back in normal mode. Some peripherals behave differently in Debug Interface mode compared to normal mode. These differences are described in more detail in the chapters of the peripherals that are affected.

When a debug session is over, the external debugger must make sure to put the device back into normal mode since the overall power consumption is higher in debug interface mode than in normal mode.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

## 4.8.4 Real-time debug

The nRF52833 supports real-time debugging.

Real-time debugging allows interrupts to execute to completion in real time when breakpoints are set in thread mode or lower priority interrupts. This enables developers to set breakpoints and single-step through the code without the risk of real-time event-driven threads running at higher priority failing. For example, this enables the device to continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while the developer steps through code in a low-priority thread.

## 4.8.5 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and the ITM is sent to an external debugger via a 4-bit wide parallel trace port interface unit (TPIU), see TRACEDATA[0] through TRACEDATA[3] and TRACECLK in [Debug and trace overview](#) on page 47.

In addition to parallel trace, the TPIU supports serial trace via the serial wire output (SWO) trace protocol. Parallel and serial trace cannot be used at the same time. ETM trace is only supported in Parallel Trace mode, while ITM trace is supported in both Parallel and Serial Trace modes.

For details on how to use the trace capabilities, read the debug documentation of your IDE.

TPIU's trace pins are multiplexed with GPIOs. SWO and TRACEDATA[0] use the same GPIO. See [Pin assignments](#) on page 557 for more information.

Trace speed is configured in register [TRACECONFIG](#) on page 93. The speed of the trace pins depends on the DRIVE setting of the GPIOs that the trace pins are multiplexed with. Only S0S1 and H0H1 drives are suitable for debugging. S0S1 is the default DRIVE setting at reset. If parallel or serial trace port signals are not fast enough with the default settings, all GPIOs in use for tracing should be set to high drive (H0H1). The DRIVE setting for these GPIOs should not be overwritten by firmware during the debugging session.

| $T_{Cyc}$ | Clock period as defined by Arm in the Timing specifications for Trace Port Physical Interface of the Embedded Trace Macrocell Architecture Specification | 62.5 |      | 500  | ns    |

# 5 Power and clock management

## 5.1 Power management unit (PMU)

Power and clock management in nRF52833 is designed to automatically ensure maximum power efficiency.

The core of the power and clock management system is the power management unit (PMU) illustrated in the following figure.

Figure 8: Power management unit

The PMU automatically detects which power and clock resources are required by the different system components at any given time. The PMU will then automatically start/stop and choose operation modes in supply regulators and clock sources, to achieve the lowest power consumption possible.

## 5.2 Current consumption

Because the system is continually being tuned by the [Power management unit \(PMU\)](#) on page 52, estimating an application's current consumption can be challenging when measurements cannot be directly performed on the hardware. To facilitate the estimation process, a set of current consumption scenarios are provided to show the typical current drawn from the VDD supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. The following table shows a set of common conditions used in all scenarios, unless otherwise stated in the description of a given scenario. All scenarios are listed in [Electrical specification](#) on page 53.

| Condition                               | Value   |
|---|---|
| Supply                                  | 3 V on VDD/VDDH (Normal voltage mode)   |
| Temperature                             | 25°C  |
| CPU                                     | WFI (wait for interrupt)/WFE (wait for event) sleep   |
| Peripherals                             | All idle  |
| Clock                                   | Not running   |
| Regulator                               | LDO   |
| RAM                                     | In System ON, full 128 kB powered. In System OFF, full 128 kB retention.  |
| Compiler                                | GCC v7.3.1 20180622 (release) [ARM/embedded-7-branch revision 261907] (GNU Tools for Arm Embedded Processors 7-2018-q3-update). <ul style="list-style-type: none"> <li>• Compiler flags: <code>-O0 -falign-functions=16 -fno-strict-aliasing -mthumb -mcpu=cortex-m4 -mfloat-abi=hard -mfpu=fpv4-sp-d16</code>.</li> </ul>                            |

| I <sub>S1</sub> | CPU running CoreMark from flash, Radio receiving @ 1 Mbps BLE mode, Clock = HFXO, Regulator = DC/DC   |      | 8.3  |      | mA    |
| I <sub>S2</sub> | CPU running CoreMark from flash, Radio transmitting @ 0 dBm output power, 1 Mbps BLE mode, Clock = HFXO   |      | 16.7 |      | mA    |
| I <sub>S3</sub> | CPU running CoreMark from flash, Radio receiving @ 1 Mbps BLE mode, Clock = HFXO  |      | 16.2 |      | mA    |

## 5.3 POWER — Power supply

The power supply consists of a number of LDO and DC/DC regulators that are utilized to maximize the system's power efficiency.

This device has the following power supply features:

- On-chip LDO and DC/DC regulators
- Global System ON/OFF modes
- Individual RAM section power control for all system modes
- Analog or digital pin wakeup from System OFF
- Supervisor hardware to manage power-on reset, brownout, and power failure
- Auto-controlled refresh modes for LDO and DC/DC regulators to maximize efficiency
- Separate USB supply

### 5.3.1 Main supply

The main supply voltage is connected to the VDD/VDDH pins. The system will enter one of two supply voltage modes, Normal or High Voltage mode, depending on how the supply voltage is connected to these pins.

The system enters Normal Voltage mode when the supply voltage is connected to both the VDD and VDDH pins (pin VDD shorted to pin VDDH). For the supply voltage range to connect to both VDD and VDDH pins, see parameter  $V_{DD}$ .

The system enters High Voltage mode when the supply voltage is only connected to the VDDH pin and the VDD pin is not connected to any voltage supply. For the supply voltage range to connect to the VDDH pin, see parameter  $V_{DDH}$ .

The register [MAINREGSTATUS](#) on page 76 can be used to read the current supply voltage mode.

#### 5.3.1.1 Main voltage regulators

The system contains two main supply regulator stages, REG0 and REG1.

REG1 regulator stage has the regulator type options of Low-dropout regulator (LDO) and Buck regulator (DC/DC). REG0 regulator stage has only the option of Low-dropout regulator (LDO).

In Normal Voltage mode, only the REG1 regulator stage is used, and the REG0 stage is automatically disabled. In High Voltage mode, both regulator stages (REG0 and REG1) are used. The output voltage of REG0 can be configured in register [REGOUT0](#) on page 43. This output voltage is connected to VDD and is the input voltage to REG1.

**Note:** In High Voltage mode, the configured output voltage for REG0 ([REGOUT0](#) on page 43) must not be greater than REG0 input voltage minus the voltage drop in REG0 ( $V_{DDH} - V_{REG0,DROP}$ ).

By default, the LDO regulators are enabled and the DC/DC regulator of REG1 stage is disabled. Register [DCDCEN](#) on page 76 is used to enable the DC/DC regulator for REG1 stage.

When the REG1 DC/DC converter is enabled, the LDO for the REG1 stage will be disabled. External LC filters must be connected for the DC/DC regulator if it is being used. The advantage of using the DC/DC regulator is that the overall power consumption is normally reduced as the efficiency of such a regulator is higher than that of a LDO. The efficiency gained by using the DC/DC regulator is best seen when the regulator voltage drop (difference between input and output voltage) is high. The efficiency of internal regulators vary with the supply voltage and the current drawn from the regulators.

**Note:** Do not enable the DC/DC regulator without an external LC filter being connected as this will inhibit device operation, including debug access, until an LC filter is connected.

#### 5.3.1.2 GPIO levels

The GPIO high reference voltage is equal to the level on the VDD pin.

In Normal Voltage mode, the GPIO high level equals the voltage supplied to the VDD pin. In High Voltage mode, it equals the level specified in register [REGOUT0](#) on page 43.

#### 5.3.1.3 Regulator configuration examples

The voltage regulators can be configured in several ways, depending on the selected supply voltage mode (Normal/High) and the regulator type option for REG1 (LDO or DC/DC).

Four configuration examples are illustrated in the following figures.

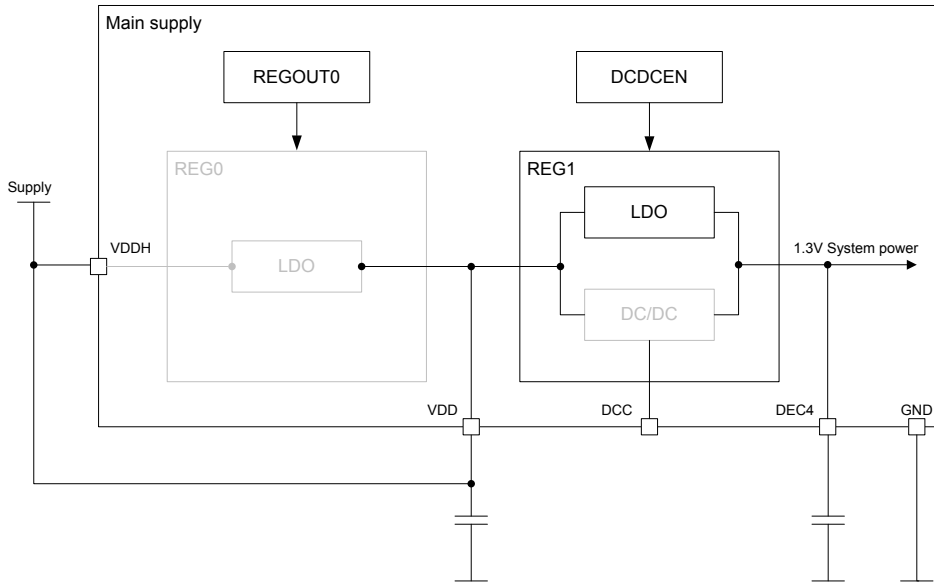

Figure 13: Normal Voltage mode, REG1 LDO

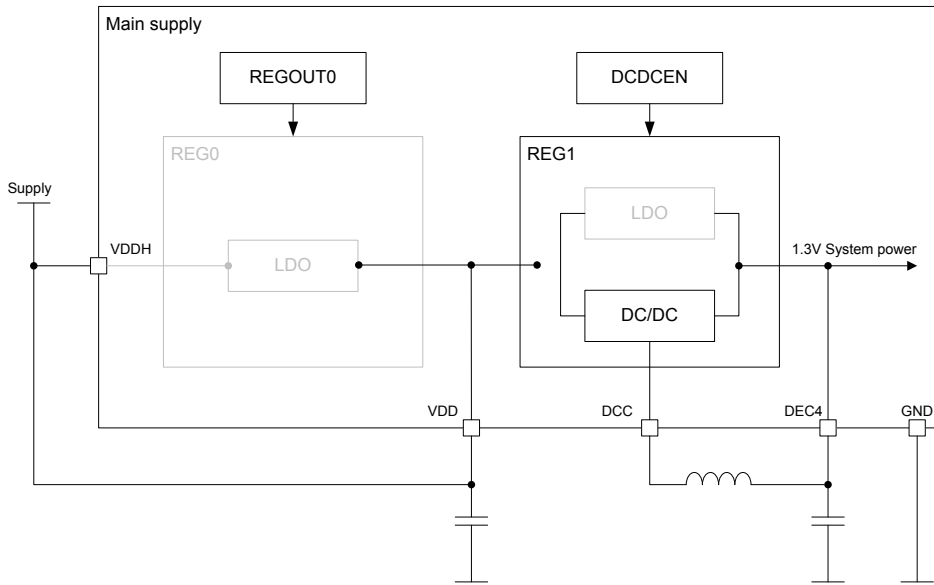

Figure 14: Normal Voltage mode, REG1 DC/DC

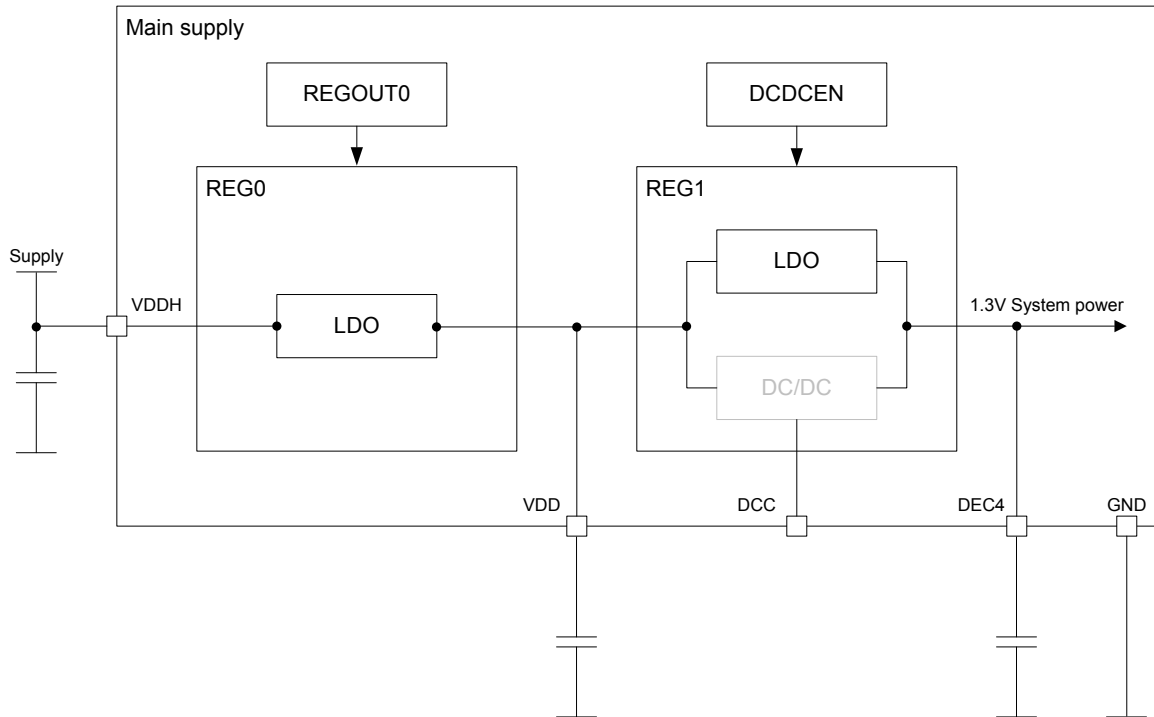

Figure 15: High Voltage mode, REG1 LDO

Figure 16: High Voltage mode, REG1 DC/DC

#### 5.3.1.4 Power supply supervisor

The power supply supervisor enables monitoring of the connected power supply.

The power supply supervisor provides the following functionality:

- Power-on reset - signals the circuit when a supply is connected

- An optional power-fail comparator (POF) - signals the application when the supply voltages drop below a configured threshold
- A fixed brownout reset detector - holds the system in reset when the voltage is too low for safe operation

The power supply supervisor is illustrated in the following figure.

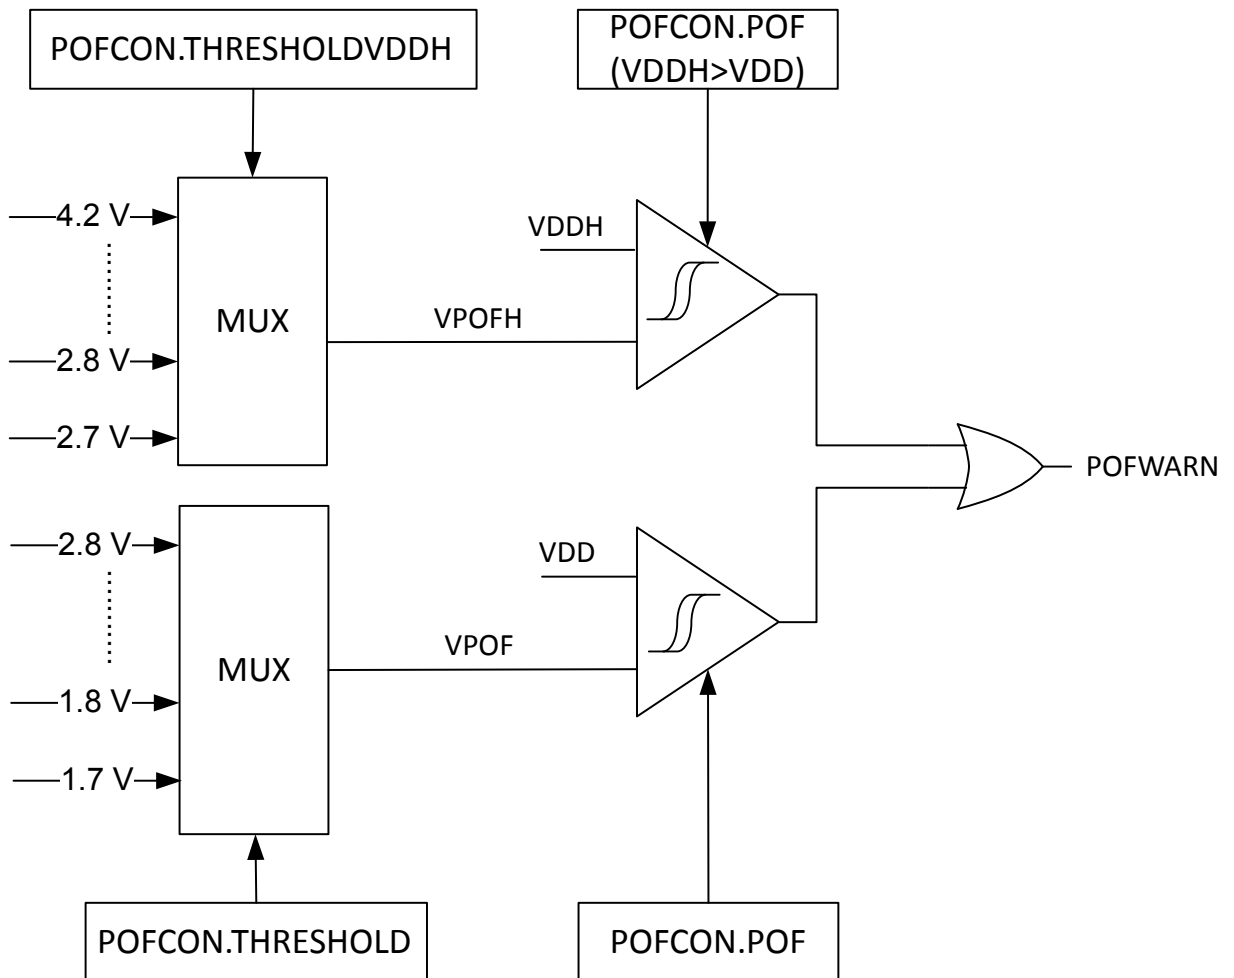

Figure 17: Power supply supervisor

### 5.3.1.5 Power-fail comparator

Using the power-fail comparator (POF) is optional. When enabled, it can provide an early warning to the CPU of an impending power supply failure.

To enable and configure the power-fail comparator, see the register [POFCON](#) on page 75.

When the supply voltage falls below the defined threshold, the power-fail comparator generates an event (POFWARN) that can be used by an application to prepare for power failure. This event is also generated when the supply voltage is already below the threshold at the time the power-fail comparator is enabled, or if the threshold is re-configured to a level above the supply voltage.

If the power failure warning is enabled, and the supply voltage is below the threshold, the power-fail comparator will prevent the [NVMC](#) from performing write operations to the flash.

The comparator features a hysteresis of  $V_{HYST}$ , as illustrated in the following figure.

Figure 18: Power-fail comparator (BOR = brownout reset)

To save power, the power-fail comparator is not active in System OFF or System ON when HFCLK is not running.

### 5.3.2 USB supply

When using the USB peripheral, a 5 V USB supply needs to be provided to the VBUS pin.

The USB peripheral has a dedicated internal voltage regulator for converting the VBUS supply to 3.3 V used by the USB signalling interface (D+ and D- lines, and pull-up on D+). The remainder of the USB peripheral (USB D) is supplied through the main supply like other on-chip features. As a consequence, VBUS and either VDDH or VDD supplies are required for USB peripheral operation.

When VBUS rises into its valid range, the software is notified through a USBDETECTED event. A USBREMOVED event is sent when VBUS goes below its valid range. Use these events to implement the USB D start-up sequence described in the [USB D](#) chapter.

When VBUS rises into its valid range while the device is in System OFF, the device resets and transitions to System ON mode. The [RESETREAS](#) register will have the VBUS bit set to indicate the source of the wake-up.

See [VBUS detection specifications](#) on page 80 for the levels at which the events are sent ( $V_{BUS,DETECT}$  and  $V_{BUS,REMOVE}$ ) or at which the system is woken up from System OFF ( $V_{BUS,DETECT}$ ).

When the USB peripheral is enabled through the [ENABLE](#) register, and VBUS is detected, the regulator is turned on. A USBPWRRDY event is sent when the regulator's worst case settling time has elapsed, indicating to the software that it can enable the USB pull-up to signal a USB connection to the host.

The software can read the state of the VBUS detection and regulator output readiness at any time through the [USBREGSTATUS](#) register.

Figure 19: USB voltage regulator

To ensure stability, the input and output of the USB regulator need to be decoupled with a suitable decoupling capacitor. See [Reference circuitry](#) on page 567 for the recommended values.

### 5.3.3 System OFF mode

System OFF is the deepest power saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device can be put into System OFF mode using the register [SYSTEMOFF](#) on page 74. When in System OFF mode, the device can be woken up through one of the following signals:

- The DETECT signal, optionally generated by the GPIO peripheral.
- The ANADETECT signal, optionally generated by the LPCOMP module.
- The SENSE signal, optionally generated by the NFC module to wake-on-field.
- Detecting a [valid USB voltage](#) on the VBUS pin ( $V_{BUS,DETECT}$ ).
- A reset.

The system is reset when it wakes up from System OFF mode.

One or more RAM sections can be retained in System OFF mode, depending on the settings in the RAM[n].POWER registers. RAM[n].POWER are retained registers. These registers are usually overwritten by the start-up code provided with the nRF application examples.

Before entering System OFF mode, all on-going EasyDMA transactions need to have completed. See peripheral specific chapters for more information about how to acquire the status of EasyDMA transactions.

### 5.3.3.1 Emulated System OFF mode

If the device is in Debug Interface mode, System OFF will be emulated to secure that all required resources needed for debugging are available during System OFF.

Required resources needed for debugging include the following key components:

- [Debug and trace](#) on page 47
- [CLOCK — Clock control](#) on page 80
- [POWER — Power supply](#) on page 58
- [NVMC — Non-volatile memory controller](#) on page 23
- [CPU](#) on page 18
- Flash memory
- RAM

See [Debug and trace](#) on page 47 for more information.

Because the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF, to prevent the CPU from executing code that normally should not be executed.

### 5.3.4 System ON mode

System ON is the default state after power-on reset. In System ON mode, all functional blocks such as the CPU or peripherals can be in IDLE or RUN mode, depending on the configuration set by the software and the state of the application executing.

Register [RESETREAS](#) on page 73 provides information about the source causing the wakeup or reset.

The system can switch the appropriate internal power sources on and off, depending on the amount of power needed at any given time. The power requirement of a peripheral is directly related to its activity level, and the activity level of a peripheral fluctuates when specific tasks are triggered or events are generated.

#### 5.3.4.1 Sub-power modes

In System ON mode, when the CPU and all peripherals are in IDLE mode, the system can reside in one of the two sub-power modes.

The sub-power modes are:

- Constant Latency
- Low-power

In Constant Latency mode, the CPU wakeup latency and the PPI task response are constant and kept at a minimum. This is secured by forcing a set of basic resources to be turned on while in sleep. The cost of constant and predictable latency is increased power consumption. Constant Latency mode is selected by triggering the CONSTLAT task.

In Low-power mode, the automatic power management system described in [System ON mode](#) on page 66 ensures that the most efficient supply option is chosen to save power. The cost of having the lowest possible power consumption is a varying CPU wakeup latency and PPI task response. Low-power mode is selected by triggering the LOWPWR task.

When the system enters System ON mode, it is by default in the sub-power mode Low-power.

### 5.3.5 RAM power control

The RAM power control registers are used for configuring the following:

- The RAM sections to be retained during System OFF
- The RAM sections to be retained and accessible during System ON

In System OFF, retention of a RAM section is configured in the RETENTION field of the corresponding register [RAM\[n\].POWER \(n=0..8\)](#) on page 77.

In System ON, retention and accessibility of a RAM section is configured in the RETENTION and POWER fields of the corresponding register [RAM\[n\].POWER \(n=0..8\)](#) on page 77.

The following table summarizes the behavior of these registers.

| Configuration | RAM section status |                    |                        |            |
|---------------|--------------------|--------------------|------------------------|------------|
|               | System on/off      | RAM[n].POWER.POWER | RAM[n].POWER.RETENTION | Accessible |
| Off           | x                  | Off                | No                     | No         |
| Off           | x                  | On                 | No                     | Yes        |
| On            | Off                | Off                | No                     | No         |
| On            | Off <sup>5</sup>   | On                 | No                     | Yes        |
| On            | On                 | x                  | Yes                    | Yes        |

Table 15: RAM section configuration

The advantage of not retaining RAM contents is that the overall current consumption is reduced.

See [Memory](#) on page 19 for more information on RAM sections.

## 5.3.6 Reset

Several sources may trigger a reset.

After a reset has occurred, register [RESETREAS](#) can be read to determine which source triggered the reset.

### 5.3.6.1 Power-on reset

The power-on reset generator initializes the system at power-on.

The system is held in reset state until the supply has reached the minimum operating voltage and the internal voltage regulators have started.

### 5.3.6.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Pin reset is configured via both registers [PSELRESET\[n\] \(n=0..1\)](#) on page 42.

### 5.3.6.3 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

The debug access port (DAP) is not reset following a wake up from System OFF mode if the device is in Debug Interface mode. See chapter [Debug and trace](#) on page 47 for more information.

### 5.3.6.4 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRCR) in the ARM® core is set.

See [ARM documentation](#) for more details.

A soft reset can also be generated via the register [RESET](#) on page 49 in the CTRL-AP.

### 5.3.6.5 Watchdog reset

A Watchdog reset is generated when the watchdog times out.

<sup>5</sup> Not useful. RAM section power off gives negligible reduction in current consumption when retention is on.

See chapter [WDT — Watchdog timer](#) on page 552 for more information.

### 5.3.6.6 Brownout reset

The brownout reset generator puts the system in a reset state if VDD drops below the brownout reset (BOR) threshold.

See section [Power fail comparator](#) on page 79 for more information.

### 5.3.6.7 Retained registers

A retained register is one that will retain its value in System OFF mode and through a reset, depending on the reset source. See the individual peripheral chapters for information on which of their registers are retained.

### 5.3.6.8 Reset behavior

The various reset sources and their targets are summarized in the table below.

| Reset source                      | Reset target |             |      |                    |        |                |     |                    |           |
|-----------------------------------|--------------|-------------|------|--------------------|--------|----------------|-----|--------------------|-----------|
|                                   | CPU          | Peripherals | GPIO | Debug <sup>6</sup> | SWJ-DP | RAM            | WDT | Retained registers | RESETREAS |
| CPU lockup <sup>7</sup>           | x            | x           | x    |                    |        |                |     |                    |           |
| Soft reset                        | x            | x           | x    |                    |        |                |     |                    |           |
| Wakeup from System OFF mode reset | x            | x           |      | x <sup>8</sup>     |        | x <sup>9</sup> | x   |                    |           |
| Watchdog reset <sup>10</sup>      | x            | x           | x    | x                  |        | x              | x   | x                  |           |
| Pin reset                         | x            | x           | x    | x                  |        | x              | x   | x                  |           |
| Brownout reset                    | x            | x           | x    | x                  | x      | x              | x   | x                  | x         |
| Power-on reset                    | x            | x           | x    | x                  | x      | x              | x   | x                  | x         |

**Note:** The RAM is never reset, but depending on a reset source the content of RAM may be corrupted.

## 5.3.7 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | POWER      | POWER    | Power control |               |

Table 16: Instances

| Register       | Offset | Description                              |
|----------------|--------|--|
| TASKS_CONSTLAT | 0x78   | Enable Constant Latency mode             |
| TASKS_LOWPWR   | 0x7C   | Enable Low-power mode (variable latency) |

<sup>6</sup> All debug components excluding SWJ-DP. See [Debug and trace](#) on page 47 for more information about the different debug components.

<sup>7</sup> Reset from CPU lockup is disabled if the device is in Debug Interface mode. CPU lockup is not possible in System OFF.

<sup>8</sup> The debug components will not be reset if the device is in Debug Interface mode.

<sup>9</sup> RAM is not reset on wakeup from System OFF mode. RAM, or certain parts of RAM, may not be retained after the device has entered System OFF mode, depending on the settings in the RAM registers.

<sup>10</sup> Watchdog reset is not available in System OFF.

| Register          | Offset | Description                           |            |
|-------------------|--------|---------------------------------------|------------|
| EVENTS_POFWARN    | 0x108  | Power failure warning                 |            |
| EVENTS_SLEEPENTER | 0x114  | CPU entered WFI/WFE sleep             |            |
| EVENTS_SLEEPEXIT  | 0x118  | CPU exited WFI/WFE sleep              |            |
| EVENTS_USBDTECTED | 0x11C  | Voltage supply detected on VBUS       |            |
| EVENTS_USBREMOVED | 0x120  | Voltage supply removed from VBUS      |            |
| EVENTS_USBPWRDY   | 0x124  | USB 3.3 V supply ready                |            |
| INTENSET          | 0x304  | Enable interrupt                      |            |
| INTENCLR          | 0x308  | Disable interrupt                     |            |
| RESETREAS         | 0x400  | Reset reason                          |            |
| RAMSTATUS         | 0x428  | RAM status register                   | Deprecated |
| USBREGSTATUS      | 0x438  | USB supply status                     |            |
| SYSTEMOFF         | 0x500  | System OFF register                   |            |
| POFCON            | 0x510  | Power-fail comparator configuration   |            |
| GPREGRET          | 0x51C  | General purpose retention register    |            |

### 5.3.7.11 RESETPREAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETPREAS register will be cumulative. A field is cleared by writing '1' to it. If none of the reset sources are flagged, this indicates that the chip was reset from the on-chip reset generator, which will indicate a power-on-reset or a brownout reset.

### 5.3.7.12 RAMSTATUS ( Deprecated )

Address offset: 0x428

RAM status register

Since this register is deprecated the following substitutions have been made: RAM block 0 is equivalent to a block comprising RAM0.S0 and RAM1.S0, RAM block 1 is equivalent to a block comprising RAM2.S0 and RAM3.S0, RAM block 2 is equivalent to a block comprising RAM4.S0 and RAM5.S0 and RAM block 3 is equivalent to a block comprising RAM6.S0 and RAM7.S0. A RAM block field will indicate ON as long as any of the RAM sections associated with a block are on.

## 5.3.8 Electrical specification

### 5.3.8.1 Regulator operating conditions

| Symbol              | Description                                      | Min. | Typ. | Max. | Units |
|---------------------|--|------|------|------|-------|
| V <sub>DD,POR</sub> | VDD supply voltage needed during power-on reset  | 1.75 |      |      | V     |
| V <sub>DD</sub>     | Normal voltage mode operating voltage            | 1.7  | 3.0  | 3.6  | V     |
| V <sub>DDH</sub>    | High voltage mode operating voltage              | 2.5  | 3.7  | 5.5  | V     |
| C <sub>VDD</sub>    | Effective decoupling capacitance on the VDD pin  | 2.7  | 4.7  | 5.5  | μF    |
| C <sub>DEC4</sub>   | Effective decoupling capacitance on the DEC4 pin | 0.7  | 1    | 1.3  | μF    |

### 5.3.8.2 Regulator specifications, REG0 stage

| Symbol                       | Description   | Min. | Typ. | Max. | Units |
|------------------------------|---|------|------|------|-------|
| V <sub>REG0OUT</sub>         | REG0 output voltage   | 1.8  |      | 3.3  | V     |
| V <sub>REG0OUT,ERR</sub>     | REG0 output voltage error (deviation from setting in <a href="#">REG0OUT</a> on page 43)  | -10  |      | 5    | %     |
| V <sub>REG0OUT,ERR,EXT</sub> | REG0 output voltage error (deviation from setting in <a href="#">REG0OUT</a> on page 43), extended temperature range                    | -10  |      | 7    | %     |
| V <sub>VDDH-VDD</sub>        | Required difference between input voltage (VDDH) and output voltage (VDD, configured in <a href="#">REG0OUT</a> on page 43), VDDH > VDD | 0.3  |      |      | V     |

### 5.3.8.3 Device startup times

| Symbol                          | Description  | Min. | Typ. | Max. | Units |
|---------------------------------|--|------|------|------|-------|
| t <sub>POR</sub>                | Time in power-on reset after supply reaches minimum operating voltage, depending on supply rise time |      |      |      |       |
| t <sub>POR,10μs</sub>           | VDD rise time 10 μs <sup>11</sup>  |      | 1    | 10   | ms    |
| t <sub>POR,10ms</sub>           | VDD rise time 10 ms <sup>11</sup>  |      | 9    |      | ms    |
| t <sub>POR,60ms</sub>           | VDD rise time 60 ms <sup>11</sup>  |      | 23   | 110  | ms    |
| t <sub>RISE,REG0OUT</sub>       | REG0 output (VDD) rise time after VDDH reaches minimum VDDH supply voltage <sup>11</sup>             |      |      |      |       |
| t <sub>RISE,REG0OUT,10μs</sub>  | VDDH rise time 10 μs <sup>11</sup>   |      | 0.22 | 1.55 | ms    |
| t <sub>RISE,REG0OUT,10ms</sub>  | VDDH rise time 10 ms <sup>11</sup>   |      | 5    |      | ms    |
| t <sub>RISE,REG0OUT,100ms</sub> | VDDH rise time 100 ms <sup>11</sup>  | 30   | 50   | 80   | ms    |
| t <sub>PINR</sub>               | Reset time when using pin reset, depending on pin capacitance  |      |      |      |       |
| t <sub>PINR,500nF</sub>         | 500 nF capacitance at reset pin  |      |      | 32.5 | ms    |

<sup>11</sup> See [Recommended operating conditions](#) on page 608 for more information.

| Symbol                    | Description  | Min.            | Typ.   | Max. | Units |
|---------------------------|--|-----------------|--------|------|-------|
| t <sub>PINR,10μF</sub>    | 10 μF capacitance at reset pin                                     |                 |        | 650  | ms    |
| t <sub>R2ON</sub>         | Time from power-on reset to System ON                              |                 |        |      |       |
| t <sub>R2ON,NOTCONF</sub> | If reset pin not configured  | tPOR            |        |      | ms    |
| t <sub>R2ON,CONF</sub>    | If reset pin configured  | tPOR +<br>tPINR |        |      | ms    |
| t <sub>OFF2ON</sub>       | Time from OFF to CPU execute                                       |                 | 16.5   |      | μs    |
| t <sub>IDLE2CPU</sub>     | Time from IDLE to CPU execute                                      |                 | 3.0    |      | μs    |
| t <sub>EVTSET,CL1</sub>   | Time from HW event to PPI event in Constant Latency System ON mode |                 | 0.0625 |      | μs    |
| t <sub>EVTSET,CL0</sub>   | Time from HW event to PPI event in Low Power System ON mode        |                 | 0.0625 |      | μs    |

### 5.3.8.4 Power fail comparator

| Symbol               | Description  | Min. | Typ. | Max. | Units |
|----------------------|--|------|------|------|-------|
| V <sub>POF,NV</sub>  | Nominal power level warning thresholds (falling supply voltage) in Normal voltage mode (supply on VDD). Levels are configurable between Min. and Max. in 100 mV increments | 1.7  |      | 2.8  | V     |
| V <sub>POF,HV</sub>  | Nominal power level warning thresholds (falling supply voltage) in High voltage mode (supply on VDDH). Levels are configurable in 100 mV increments                        | 2.7  |      | 4.2  | V     |
| V <sub>POFTOL</sub>  | Threshold voltage tolerance (applies in both Normal voltage mode and High voltage mode)  | -5   |      | 5    | %     |
| V <sub>POFHYST</sub> | Threshold voltage hysteresis (applies in both Normal voltage mode and High voltage mode)   | 40   | 50   | 60   | mV    |
| V <sub>BOR,OFF</sub> | Brownout reset voltage range System OFF mode. Brownout only applies to the voltage on VDD  | 1.2  |      | 1.62 | V     |
| V <sub>BOR,ON</sub>  | Brownout reset voltage range System ON mode. Brownout only applies to the voltage on VDD   | 1.57 | 1.6  | 1.63 | V     |

### 5.3.8.5 USB operating conditions

| Symbol            | Description                | Min.      | Typ. | Max.         | Units |

## 5.4 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators and distribute them to modules based upon a module's individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Listed here are the main features for CLOCK:

- 64 MHz on-chip oscillator
- 64 MHz crystal oscillator, using external 32 MHz crystal
- 32.768 kHz +/-500 ppm RC oscillator
- 32.768 kHz crystal oscillator, using external 32.768 kHz crystal
- 32.768 kHz oscillator synthesized from 64 MHz oscillator
- Firmware (FW) override control of crystal oscillator activity for low latency start up
- Automatic internal oscillator and clock control, and distribution for ultra-low power

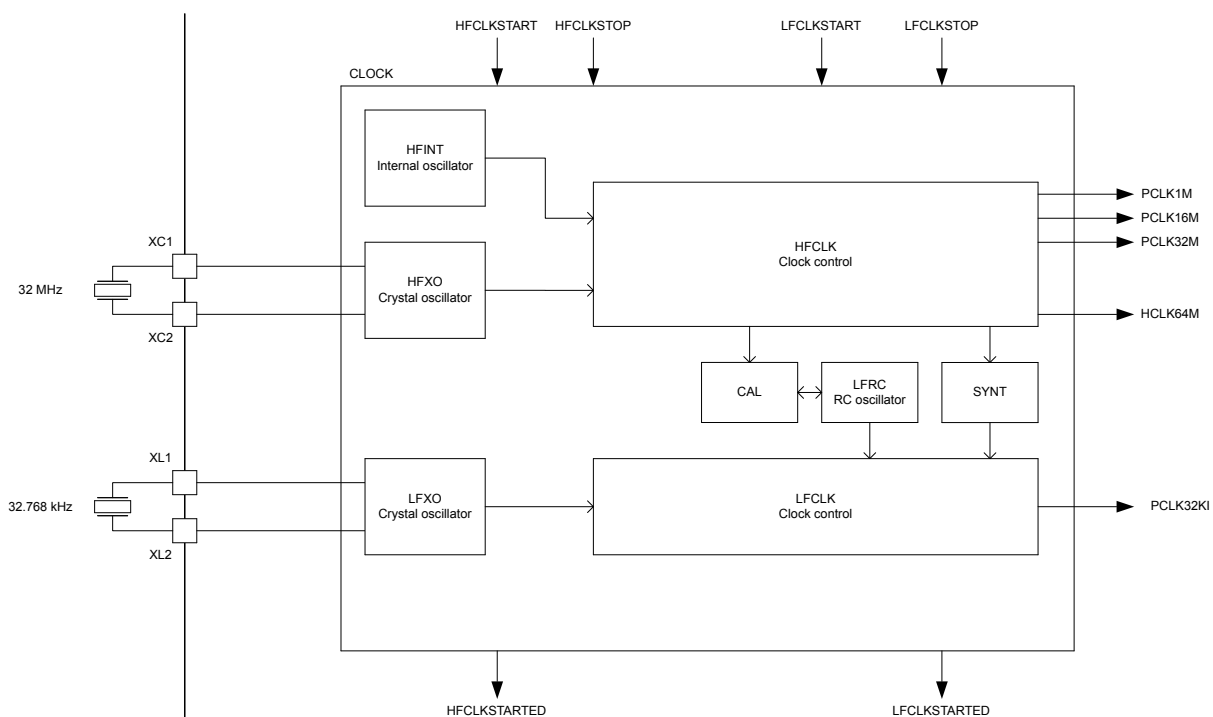

Figure 20: Clock control

### 5.4.1 HFCLK controller

The HFCLK controller provides several clock signals in the system.

These are as follows:

- HCLK64M: 64 MHz CPU clock
- PCLK1M: 1 MHz peripheral clock
- PCLK16M: 16 MHz peripheral clock
- PCLK32M: 32 MHz peripheral clock

The HFCLK controller uses the following high frequency clock (HFCLK) sources:

- 64 MHz internal oscillator (HFINT)
- 64 MHz crystal oscillator (HFXO)

For illustration, see [Clock control](#) on page 80.

The HFCLK controller will automatically provide the clock(s) requested by the system. If the system does not request any clocks from the HFCLK controller, the controller will enter a power saving mode.

The HFINT source will be used when HFCLK is requested and HFXO has not been started.

The HFXO is started by triggering the HFCLKSTART task and stopped by triggering the HFCLKSTOP task. When the HFCLKSTART task is triggered, the HFCLKSTARTED event is generated once the HFXO startup time has elapsed. The HFXO startup time is given as the sum of the following:

- HFXO power-up time, as specified in [64 MHz crystal oscillator \(HFXO\)](#) on page 93.
- HFXO debounce time, as specified in register [HFXODEBOUNCE](#) on page 92.

The HFXO must be running to use the RADIO or the calibration mechanism associated with the 32.768 kHz RC oscillator.

#### 5.4.1.1 64 MHz crystal oscillator (HFXO)

The 64 MHz crystal oscillator (HFXO) is controlled by a 32 MHz external crystal.

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet.

[Circuit diagram of the 64 MHz crystal oscillator](#) on page 81 shows how the 32 MHz crystal is connected to the 64 MHz crystal oscillator.

Figure 21: Circuit diagram of the 64 MHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 567.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XC1 and XC2 pins. See table [64 MHz crystal oscillator \(HFXO\)](#) on page 93. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in table [64 MHz crystal oscillator \(HFXO\)](#) on page 93. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both start up time and current consumption.

## 5.4.2 LFCLK controller

The system supports several low frequency clock sources.

As illustrated in [Clock control](#) on page 80, the system supports the following low frequency clock sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

The LFCLK controller and all of the LFCLK clock sources are always switched off when in System OFF mode.

The LFCLK clock is started by first selecting the preferred clock source in register [LFCLKSRC](#) on page 91 and then triggering the LFCLKSTART task. If the LFXO is selected as the clock source, the LFCLK will initially start running from the 32.768 kHz LFRC while the LFXO is starting up and automatically switch to using the LFXO once this oscillator is running. The LFCLKSTARTED event will be generated when the LFXO has been started.

The register [LFXODEBOUNCE](#) on page 92 is used to configure the LFXO debounce time. The register must be modified if operating in the Extended Operating Conditions temperature range, see [Recommended operating conditions](#) on page 608. The LFXO start up time will be increased as a result.

The LFCLK clock is stopped by triggering the LFCLKSTOP task.

Register [LFCLKSRC](#) on page 91 controls the clock source, and its allowed swing. The truth table for various situations is as follows:

| SRC | EXTERNAL | BYPASS | Comment  |
|-----|----------|--------|--|
| 0   | 0        | 0      | Normal operation, LFRC is source   |
| 0   | 0        | 1      | DO NOT USE   |
| 0   | 1        | X      | DO NOT USE   |
| 1   | 0        | 0      | Normal XTAL operation  |
| 1   | 1        | 0      | Apply external low swing signal to XL1, ground XL2                         |
| 1   | 1        | 1      | Apply external full swing signal to XL1, leave XL2 grounded or unconnected |
| 1   | 0        | 1      | DO NOT USE   |
| 2   | 0        | 0      | Normal operation, LFSYNT is source   |
| 2   | 0        | 1      | DO NOT USE   |
| 2   | 1        | X      | DO NOT USE   |

Table 18: LFCLKSRC configuration depending on clock source

It is not allowed to write to register **LFCLKSRC** on page 91 when the LFCLK is running.

A LFCLKSTOP task will stop the LFCLK oscillator. However, the LFCLKSTOP task can only be triggered after the STATE field in register **LFCLKSTAT** on page 91 indicates LFCLK running state.

The synthesized 32.768 kHz clock depends on the HFCLK to run. If high accuracy is required for the LFCLK running off the synthesized 32.768 kHz clock, the HFCLK must running from the HFXO source.

#### 5.4.2.1 32.768 kHz RC oscillator (LFRC)

The default source of the low frequency clock (LFCLK) is the 32.768 kHz RC oscillator (LFRC).

The LFRC oscillator does not require additional external components.

The LFRC frequency will be affected by variation in temperature. The LFRC oscillator can be calibrated to improve accuracy by using the HFXO as a reference oscillator during calibration.

#### 5.4.2.2 Calibrating the 32.768 kHz RC oscillator

After the LFRC oscillator is started and running, it can be calibrated by triggering the CAL task.

The LFRC oscillator will then temporarily request the HFCLK to be used as a reference for the calibration. A DONE event will be generated when calibration has finished. The HFCLK crystal oscillator has to be started (by triggering the HFCLKSTART task) in order for the calibration mechanism to work.

It is not allowed to stop the LFRC during an ongoing calibration.

#### 5.4.2.3 Calibration timer

The calibration timer can be used to time the calibration interval of the 32.768 kHz RC oscillator.

The calibration timer is started by triggering the CTSTART task and stopped by triggering the CTSTOP task. The calibration timer will always start counting down from the value specified in **CTIV (Retained)** on page 93 and generate a CTTO event when it reaches 0. The calibration timer will automatically stop when it reaches 0.

Figure 22: Calibration timer

After a CTSTART task has been triggered, the calibration timer will ignore further tasks until it has returned the CTSTARTED event. Likewise, after a CTSTOP task has been triggered, the calibration timer will ignore further tasks until it has returned a CTSTOPPED event. Triggering CTSTART while the calibration timer

is running will immediately return a CTSTARTED event. Triggering CTSTOP when the calibration timer is stopped will immediately return a CTSTOPPED event.

#### 5.4.2.4 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy (when better than +/- 500 ppm accuracy is required), the low frequency crystal oscillator (LFXO) must be used.

The following external clock sources are supported:

- Low swing clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded.
- Rail-to-rail clock signal applied to the *XL1* pin. The *XL2* pin shall then be grounded or left unconnected.

To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. [Circuit diagram of the 32.768 kHz crystal oscillator](#) on page 84 shows the LFXO circuitry.

Figure 23: Circuit diagram of the 32.768 kHz crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is given by:

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitances on the PCB.  $C_{pin}$  is the pin input capacitance on the XC1 and XC2 pins (see [Low frequency crystal oscillator \(LFXO\)](#) on page 94). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 567.

#### 5.4.2.5 32.768 kHz synthesized from HFCLK (LFSYNT)

LFCLK can also be synthesized from the HFCLK clock source. The accuracy of LFCLK will then be the accuracy of the HFCLK.

Using the LFSYNT clock avoids the requirement for a 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

## 5.4.3 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40000000   | CLOCK      | CLOCK    | Clock control |               |

Table 19: Instances

| Register            | Offset | Description  |          |
|---------------------|--------|--|----------|
| TASKS_HFCLKSTART    | 0x000  | Start HFXO crystal oscillator  |          |
| TASKS_HFCLKSTOP     | 0x004  | Stop HFXO crystal oscillator   |          |
| TASKS_LFCLKSTART    | 0x008  | Start LFCLK  |          |
| TASKS_LFCLKSTOP     | 0x00C  | Stop LFCLK   |          |
| TASKS_CAL           | 0x010  | Start calibration of LFRC  |          |
| TASKS_CTSTART       | 0x014  | Start calibration timer  |          |
| TASKS_CTSTOP        | 0x018  | Stop calibration timer   |          |
| EVENTS_HFCLKSTARTED | 0x100  | HFXO crystal oscillator started  |          |
| EVENTS_LFCLKSTARTED | 0x104  | LFCLK started  |          |
| EVENTS_DONE         | 0x10C  | Calibration of LFRC completed  |          |
| EVENTS_CTTO         | 0x110  | Calibration timer timeout  |          |
| EVENTS_CTSTARTED    | 0x128  | Calibration timer has been started and is ready to process new tasks   |          |
| EVENTS_CTSTOPPED    | 0x12C  | Calibration timer has been stopped and is ready to process new tasks   |          |
| INTENSET            | 0x304  | Enable interrupt   |          |
| INTENCLR            | 0x308  | Disable interrupt  |          |
| HFCLKRUN            | 0x408  | Status indicating that HFCLKSTART task has been triggered  |          |
| HFCLKSTAT           | 0x40C  | HFCLK status   |          |
| LFCLKRUN            | 0x414  | Status indicating that LFCLKSTART task has been triggered  |          |
| LFCLKSTAT           | 0x418  | LFCLK status   |          |
| LFCLKSRC_COPY       | 0x41C  | Copy of LFCLKSRC register, set when LFCLKSTART task was triggered  |          |
| LFCLKSRC            | 0x518  | Clock source for the LFCLK   |          |
| HFXODEBOUNCE        | 0x528  | HFXO debounce time. The HFXO is started by triggering the TASKS_HFCLKSTART task.   |          |
| LFXODEBOUNCE        | 0x52C  | LFXO debounce time. The LFXO is started by triggering the TASKS_LFCLKSTART task when the LFCLKSRC register is configured for Xtal. |          |
| CTIV                | 0x538  | Calibration timer interval   | Retained |
| TRACECONFIG         | 0x55C  | Clocking options for the trace port debug interface  |          |

### 5.4.3.22 HFXODEBOUNCE

Address offset: 0x528

HFXO debounce time. The HFXO is started by triggering the TASKS\_HFCLKSTART task.

The EVENTS\_HFCLKSTARTED event is generated after the HFXO power up time + the HFXO debounce time has elapsed. It is not allowed to change the value of this register while the HFXO is starting.

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |              |          |            |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |  |

| t <sub>POWERUP_X32M_X1</sub> | Typical parameters for a given 1.6mm x 1.2mm crystal:<br>CL_HFXO = 8 pF, C <sub>0_HFXO</sub> = 0.4 pF, LM_HFXO = 20 mH,<br>RS_HFXO = 40 Ω |      | 200  |      | μs    |

### 5.4.4.3 Low frequency crystal oscillator (LFXO)

| Symbol                    | Description                                    | Min. | Typ.   | Max. | Units |
|---------------------------|--|------|--------|------|-------|
| f <sub>NOM_LFXO</sub>     | Crystal frequency                              |      | 32.768 |      | kHz   |
| f <sub>TOL_LFXO_BLE</sub> | Frequency tolerance requirement for BLE stack  |      |        | ±500 | ppm   |
| f <sub>TOL_LFXO_ANT</sub> | Frequency tolerance requirement for ANT stack  |      |        | ±50  | ppm   |
| C <sub>L_LFXO</sub>       | Load capacitance                               |      |        | 12.5 | pF    |
| C <sub>0_LFXO</sub>       | Shunt capacitance                              |      |        | 2    | pF    |
| R <sub>S_LFXO</sub>       | Equivalent series resistance                   |      |        | 100  | kΩ    |
| P <sub>D_LFXO</sub>       | Drive level                                    |      |        | 0.5  | μW    |
| C <sub>pin</sub>          | Input capacitance on XL1 and XL2 pads          |      | 4      |      | pF    |
| I <sub>LFXO</sub>         | Run current for 32.768 kHz crystal oscillator  |      | 0.23   |      | μA    |
| t <sub>START_LFXO</sub>   | Startup time for 32.768 kHz crystal oscillator |      | 0.25   |      | s     |

| Symbol                      | Description  | Min. | Typ. | Max. | Units |
|-----------------------------|--|------|------|------|-------|
| t <sub>START_LFXO_EXT</sub> | Startup time for 32.768 kHz crystal oscillator when<br>CLOCK.LFXODEBOUNCE configured for Extended debounce<br>time |      | 0.5  |      | s     |

#### 5.4.4.4 Low frequency RC oscillator (LFRC)

| Symbol                    | Description   | Min. | Typ.   | Max. | Units |
|---------------------------|---|------|--------|------|-------|
| f <sub>NOM_LFRC</sub>     | Nominal frequency                                   |      | 32.768 |      | kHz   |
| f <sub>TOL_LFRC</sub>     | Frequency tolerance, uncalibrated                   |      |        | ±5   | %     |
| f <sub>TOL_CAL_LFRC</sub> | Frequency tolerance after calibration <sup>12</sup> |      |        | ±500 | ppm   |
| I <sub>LFRC</sub>         | Run current   |      | 0.7    |      | μA    |
| t <sub>START_LFRC</sub>   | Startup time  |      | 1000   |      | μs    |

#### 5.4.4.5 Synthesized low frequency clock (LFSYNT)

| Symbol                  | Description       | Min. | Typ.   | Max. | Units |
|-------------------------|-------------------|------|--------|------|-------|
| f <sub>NOM_LFSYNT</sub> | Nominal frequency |      | 32.768 |      | kHz   |

<sup>12</sup> Constant temperature within ±0.5 °C, calibration performed at least every 8 seconds, averaging interval > 7.5 ms, defined as 3 sigma

# 6 Peripherals

## 6.1 Peripheral interface

Peripherals are controlled by the CPU by writing to configuration registers and task registers. Peripheral events are indicated to the CPU by event registers and interrupts if they are configured for a given event.

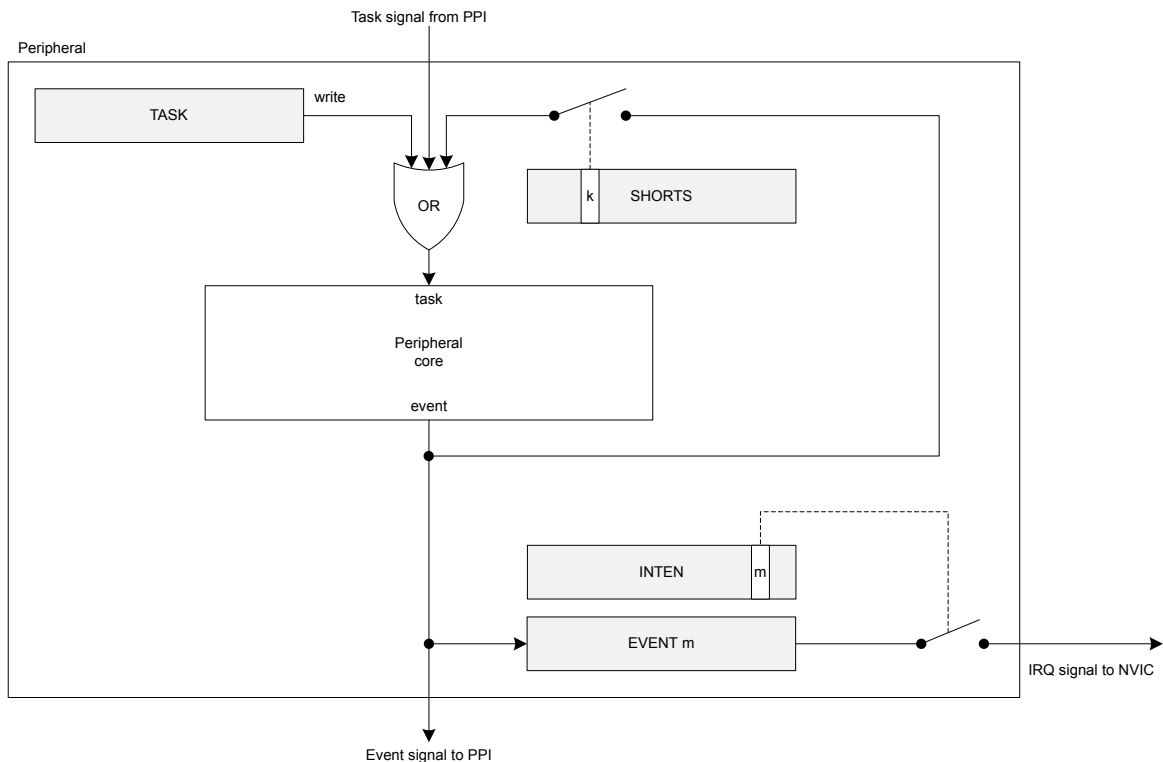

Figure 24: Tasks, events, shortcuts, and interrupts

### 6.1.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Instantiation](#) on page 22 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Some peripherals share some registers or other common resources.
- Operation is mutually exclusive. Only one of the peripherals can be used at a time.
- Switching from one peripheral to another must follow a specific pattern (disable the first, then enable the second peripheral).

## 6.1.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. The user can only enable one peripheral at the time on this specific ID.

When switching between two peripherals sharing an ID, the user should do the following to prevent unwanted behavior:

1. Disable the previously used peripheral.
2. Remove any programmable peripheral interconnect (PPI) connections set up for the peripheral that is being disabled.
3. Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
4. Explicitly configure the peripheral that you are about to enable and do not rely on configuration values that may be inherited from the peripheral that was disabled.
5. Enable the now configured peripheral.

See which peripherals are sharing ID in [Instantiation](#) on page 22.

## 6.1.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified in the relevant chapter, the peripheral registers (in particular the PSEL registers) must be configured before enabling the peripheral.

The peripheral must be enabled before tasks and events can be used.

## 6.1.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

The SET register is used to set individual bits in the main register while the CLR register is used to clear individual bits in the main register. Writing 1 to a bit in SET or CLR register will set or clear the same bit in the main register respectively. Writing 0 to a bit in SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

**Note:** The main register may not be visible and hence not directly accessible in all cases.

## 6.1.5 Tasks

Tasks are used to trigger actions in a peripheral, for example to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes 1 to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See [Tasks, events, shortcuts, and interrupts](#) on page 96.

## 6.1.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events with each event having a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated. See [Tasks, events, shortcuts, and interrupts](#) on page 96. An event register is only cleared when firmware writes 0 to it.

Events can be generated by the peripheral even when the event register is set to 1.

### 6.1.7 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using a shortcut is the equivalent to making the same connection outside the peripheral and through the PPI. However, the propagation delay through the shortcut is usually shorter than the propagation delay through the PPI.

Shortcuts are predefined, which means their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

### 6.1.8 Interrupts

All peripherals support interrupts. Interrupts are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using the INTEN, INTENSET, and INTENCLR registers, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is shown in [Tasks, events, shortcuts, and interrupts](#) on page 96.

#### Interrupt clearing

Clearing an interrupt by writing 0 to an event register, or disabling an interrupt using the INTENCLR register, can take up to four CPU clock cycles to take effect. This means that an interrupt may reoccur immediately, even if a new event has not come, if the program exits an interrupt handler after the interrupt is cleared or disabled but before four clock cycles have passed.

**Note:** To avoid an interrupt reoccurring before a new event has come, the program should perform a read from one of the peripheral registers. For example, the event register that has been cleared, or the INTENCLR register that has been used to disable the interrupt. This will cause a one to three-cycle delay and ensure the interrupt is cleared before exiting the interrupt handler.

Care should be taken to ensure the compiler does not remove the read operation as an optimization. If the program can guarantee a four-cycle delay after an event is cleared or an interrupt is disabled, then a read of a register is not required.

## 6.2 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0*. Resolvable Private Address generation should be achieved using ECB and is not supported by AAR.

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. The AAR block enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in *Bluetooth*).

### 6.2.1 EasyDMA

The AAR implements EasyDMA for reading and writing to the RAM. The EasyDMA will have finished accessing the RAM when the END, RESOLVED, and NOTRESOLVED events are generated.

If the [IRKPTR](#) on page 104, [ADDRPTR](#) on page 104, and the [SCRATCHPTR](#) on page 104 is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

### 6.2.2 Resolving a resolvable address

As per *Bluetooth* specification, a private resolvable address is composed of six bytes.

Figure 25: Resolvable address

To resolve an address the register [ADDRPTR](#) on page 104 must point to the start of the packet. The resolver is started by triggering the START task. A RESOLVED event is generated when the AAR manages to resolve the address using one of the Identity Resolving Keys (IRK) found in the IRK data structure. The AAR will use the IRK specified in the register IRK0 to IRK15 starting from IRK0. The register [NIRK](#) on page 103 specifies how many IRKs should be used. The AAR module will generate a NOTRESOLVED event if it is not able to resolve the address using the specified list of IRKs.

The AAR will go through the list of available IRKs in the IRK data structure and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification v4.0 [Vol 3]* chapter 10.8.2.3. The time it takes to resolve an address varies due to the location in the list of the resolvable address. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the [Electrical specifications](#) for more information about resolution time.

The AAR only compares the received address to those programmed in the module without checking the address type.

The AAR will stop as soon as it has managed to resolve the address, or after trying to resolve the address using [NIRK](#) number of IRKs from the IRK data structure. The AAR will generate an END event after it has stopped.

Figure 26: Address resolution with packet preloaded into RAM

### 6.2.3 Use case example for chaining RADIO packet reception with address resolution using AAR

The AAR may be started as soon as the 6 bytes required by the AAR have been received by the RADIO and stored in RAM. The ADDRPTR pointer must point to the start of packet.

Figure 27: Address resolution with packet loaded into RAM by the RADIO

### 6.2.4 IRK data structure

The IRK data structure is located in RAM at the memory location specified by the IRKPTR register.

| Property | Address offset | Description              |
|----------|----------------|--------------------------|
| IRK0     | 0              | IRK number 0 (16 bytes)  |
| IRK1     | 16             | IRK number 1 (16 bytes)  |
| ..       | ..             | ..                       |
| IRK15    | 240            | IRK number 15 (16 bytes) |

Table 21: IRK data structure overview

### 6.2.5 Registers

| Base address | Peripheral | Instance | Description                  | Configuration |
|--------------|------------|----------|------------------------------|---------------|
| 0x4000F000   | AAR        | AAR      | Accelerated address resolver |               |

Table 22: Instances

| Register    | Offset | Description   |
|-------------|--------|---|
| TASKS_START | 0x000  | Start resolving addresses based on IRKs specified in the IRK data structure |
| TASKS_STOP  | 0x008  | Stop resolving addresses  |
| EVENTS_END  | 0x100  | Address resolution procedure complete                                       |

| Register           | Offset | Description                                     |
|--------------------|--------|---|
| EVENTS_RESOLVED    | 0x104  | Address resolved                                |
| EVENTS_NOTRESOLVED | 0x108  | Address not resolved                            |
| INTENSET           | 0x304  | Enable interrupt                                |
| INTENCLR           | 0x308  | Disable interrupt                               |
| STATUS             | 0x400  | Resolution status                               |
| ENABLE             | 0x500  | Enable AAR                                      |
| NIRK               | 0x504  | Number of IRKs                                  |
| IRKPTR             | 0x508  | Pointer to IRK data structure                   |
| ADDRPTR            | 0x510  | Pointer to the resolvable address               |
| SCRATCHPTR         | 0x514  | Pointer to data area used for temporary storage |

Table 23: Register overview

A space of minimum 3 bytes must be reserved. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 6.2.6 Electrical specification

### 6.2.6.1 AAR Electrical Specification

| Symbol             | Description   | Min. | Typ. | Max. | Units |
|--------------------|---|------|------|------|-------|
| t <sub>AAR</sub>   | Address resolution time per IRK. Total time for several IRKs is given as (1 μs + n * t <sub>AAR</sub> ), where n is the number of IRKs. (Given priority to the actual destination RAM block). |      |      | 6    | μs    |
| t <sub>AAR,8</sub> | Time for address resolution of 8 IRKs. (Given priority to the actual destination RAM block).  |      |      | 49   | μs    |

## 6.3 ACL — Access control lists

The Access control lists (ACL) peripheral is designed to assign and enforce access permissions to different regions of the on-chip flash memory map.

Flash memory regions can be assigned individual ACL permission schemes. The following registers are involved:

- PERM register, where the permissions are configured.
- ADDR register, where the word-aligned start address for the flash page is defined.
- SIZE register, where the size of the region the permissions are applied to is determined.

**Note:** The size of the region in bytes is restricted to a multiple of the flash page size, and the maximum region size is limited to half the flash size. See [Memory](#) on page 19 for more information.

Figure 28: Protected regions of on-chip flash memory

There are four defined ACL permission schemes, with different combinations of read/write permissions:

| Read | Write | Protection description   |
|------|-------|--|
| 0    | 0     | No protection. Entire region can be executed, read, written or erased. |
| 0    | 1     | Region can be executed and read, but not written or erased.            |
| 1    | 0     | Region can be written and erased, but not executed or read.            |
| 1    | 1     | Region is locked for all access until next reset.                      |

Table 24: Permission schemes

**Note:** If a permission violation to a protected region is detected by the ACL peripheral, the request is blocked and a Bus Fault exception is triggered.

Access control to a configured region is enforced by the hardware two CPU clock cycles after the ADDR, SIZE, and PERM registers for an ACL instance have been successfully written. The protection is only enforced if a valid start address of the flash page boundary is written into the ADDR register, and the values of the SIZE and PERM registers are not zero.

The ADDR, SIZE, and PERM registers can only be written once. All ACL configuration registers are cleared on reset (by resetting the device from any reset source), which is also the only way of clearing the configuration registers. To ensure that the desired permission schemes are always enforced by the ACL peripheral, the device boot sequence must perform the necessary configuration.

Debugger read access to a read-protected region will be Read-As-Zero (RAZ), while debugger write access to a write-protected region will be Write-Ignored (WI).

### 6.3.1 Registers

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x4001E000   | ACL        | ACL      | Access control lists |               |

Table 25: Instances

| Register       | Offset | Description  |
|----------------|--------|--|
| ACL[0].ADDR    | 0x800  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[0].SIZE    | 0x804  | Size of region to protect counting from address ACL[0].ADDR. Write '0' as no effect.         |
| ACL[0].PERM    | 0x808  | Access permissions for region 0 as defined by start address ACL[0].ADDR and size ACL[0].SIZE |
| ACL[0].UNUSED0 | 0x80C  | Reserved   |
| ACL[1].ADDR    | 0x810  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[1].SIZE    | 0x814  | Size of region to protect counting from address ACL[1].ADDR. Write '0' as no effect.         |
| ACL[1].PERM    | 0x818  | Access permissions for region 1 as defined by start address ACL[1].ADDR and size ACL[1].SIZE |
| ACL[1].UNUSED0 | 0x81C  | Reserved   |
| ACL[2].ADDR    | 0x820  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[2].SIZE    | 0x824  | Size of region to protect counting from address ACL[2].ADDR. Write '0' as no effect.         |
| ACL[2].PERM    | 0x828  | Access permissions for region 2 as defined by start address ACL[2].ADDR and size ACL[2].SIZE |
| ACL[2].UNUSED0 | 0x82C  | Reserved   |
| ACL[3].ADDR    | 0x830  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[3].SIZE    | 0x834  | Size of region to protect counting from address ACL[3].ADDR. Write '0' as no effect.         |
| ACL[3].PERM    | 0x838  | Access permissions for region 3 as defined by start address ACL[3].ADDR and size ACL[3].SIZE |
| ACL[3].UNUSED0 | 0x83C  | Reserved   |
| ACL[4].ADDR    | 0x840  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[4].SIZE    | 0x844  | Size of region to protect counting from address ACL[4].ADDR. Write '0' as no effect.         |
| ACL[4].PERM    | 0x848  | Access permissions for region 4 as defined by start address ACL[4].ADDR and size ACL[4].SIZE |
| ACL[4].UNUSED0 | 0x84C  | Reserved   |
| ACL[5].ADDR    | 0x850  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[5].SIZE    | 0x854  | Size of region to protect counting from address ACL[5].ADDR. Write '0' as no effect.         |
| ACL[5].PERM    | 0x858  | Access permissions for region 5 as defined by start address ACL[5].ADDR and size ACL[5].SIZE |
| ACL[5].UNUSED0 | 0x85C  | Reserved   |
| ACL[6].ADDR    | 0x860  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[6].SIZE    | 0x864  | Size of region to protect counting from address ACL[6].ADDR. Write '0' as no effect.         |
| ACL[6].PERM    | 0x868  | Access permissions for region 6 as defined by start address ACL[6].ADDR and size ACL[6].SIZE |
| ACL[6].UNUSED0 | 0x86C  | Reserved   |
| ACL[7].ADDR    | 0x870  | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[7].SIZE    | 0x874  | Size of region to protect counting from address ACL[7].ADDR. Write '0' as no effect.         |
| ACL[7].PERM    | 0x878  | Access permissions for region 7 as defined by start address ACL[7].ADDR and size ACL[7].SIZE |

| Register       | Offset | Description |
|----------------|--------|-------------|
| ACL[7].UNUSED0 | 0x87C  | Reserved    |

Table 26: Register overview

### 6.3.1.1 ACL[n].ADDR (n=0..7)

Address offset:  $0x800 + (n \times 0x10)$

Start address of region to protect. The start address must be word-aligned.

This register can only be written once.

| Bit number              | 31         | 30       | 29       | 28  | 27       | 26       | 25       | 24       | 23       | 22       | 21       | 20       | 19       | 18       | 17       | 16       | 15       | 14       | 13       | 12       | 11       | 10       | 9        | 8        | 7        | 6        | 5        | 4        | 3        | 2        | 1 | 0 |

## 6.4 CCM — AES CCM mode encryption

Cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality during data transfer. CCM combines counter mode encryption and CBC-MAC authentication. The CCM terminology "Message authentication code (MAC)" is called the "Message integrity check (MIC)" in *Bluetooth* terminology and also in this document.

The CCM block generates an encrypted keystream that is applied to input data using the XOR operation and generates the 4 byte MIC field in one operation. The CCM and radio can be configured to work synchronously. The CCM will encrypt in time for transmission and decrypt after receiving bytes into memory from the radio. All operations can complete within the packet RX or TX time. CCM on this device is implemented according to *Bluetooth* requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The *Bluetooth* specification describes the configuration of counter mode blocks and encryption blocks to implement compliant encryption for BLE.

The CCM block uses EasyDMA to load key, counter mode blocks (including the nonce required), and to read/write plain text and cipher text.

The AES CCM supports three operations: key-stream generation, packet encryption, and packet decryption. All these operations are done in compliance with the *Bluetooth* specification.<sup>13</sup>

Figure 29: Key-stream generation followed by encryption or decryption. The shortcut is optional.

### 6.4.1 Key-steam generation

A new key-stream needs to be generated before a new packet encryption or packet decryption operation can be started.

A key-stream is generated by triggering the KSGEN task and an ENDKSGEN event will be generated when the key-stream has been generated.

Key-stream generation, packet encryption, and packet decryption operations utilize the configuration specified in the data structure pointed to by [CNFPTR](#) on page 118. It is necessary to configure this pointer and its underlying data structure, and the [MODE](#) on page 117 register before the KSGEN task is triggered.

The key-stream will be stored in the AES CCM's temporary memory area, specified by the [SCRATCHPTR](#) on page 118, where it will be used in subsequent encryption and decryption operations.

For default length packets (`MODE.LENGTH = Default`) the size of the generated key-stream is 27 bytes. When using extended length packets (`MODE.LENGTH = Extended`) the [MAXPACKETSIZE](#) on page 119 register specifies the length of the key-stream to be generated. The length of the generated key-stream must be greater or equal to the length of the subsequent packet payload to be encrypted or decrypted. The maximum length of the key-stream in extended mode is 251 bytes, which means that the maximum packet payload size is 251.

<sup>13</sup> *Bluetooth* AES CCM 128 bit block encryption, see *Bluetooth* Core specification Version 4.0.

If a shortcut is used between ENDKSGEN event and CRYPT task, the [INPTR](#) on page 118 pointer and the [OUTPTR](#) on page 118 pointers must also be configured before the KSGEN task is triggered.

## 6.4.2 Encryption

During packet encryption, the AES CCM will read the unencrypted packet located in RAM at the address specified in the [INPTR](#) pointer, encrypt the packet and append a four byte long Message Integrity Check (MIC) field to the packet.

Encryption is started by triggering the CRYPT task with the [MODE](#) on page 117 register set to ENCRYPTION. An ENDCRYPT event will be generated when packet encryption is completed

The AES CCM will also modify the length field of the packet to adjust for the appended MIC field, that is, add four bytes to the length, and store the resulting packet back into RAM at the address specified in the [OUTPTR](#) on page 118 pointer, see [Encryption](#) on page 109.

Empty packets (length field is set to 0) will not be encrypted but instead moved unmodified through the AES CCM.

The CCM supports different widths of the LENGTH field in the data structure for encrypted packets. This is configured in the [MODE](#) on page 117 register.

Figure 30: Encryption

## 6.4.3 Decryption

During packet decryption, the AES CCM will read the encrypted packet located in RAM at the address specified in the [INPTR](#) pointer, decrypt the packet, authenticate the packet's MIC field and generate the appropriate MIC status.

Decryption is started by triggering the CRYPT task with the [MODE](#) on page 117 register set to DECRYPTION. An ENDCRYPT event will be generated when packet decryption is completed

The AES CCM will also modify the length field of the packet to adjust for the MIC field, that is, subtract four bytes from the length, and then store the decrypted packet into RAM at the address pointed to by the [OUTPTR](#) pointer, see [Decryption](#) on page 110.

The CCM is only able to decrypt packet payloads that are at least 5 bytes long, that is, 1 byte or more encrypted payload (EPL) and 4 bytes of MIC. The CCM will therefore generate a MIC error for packets where the length field is set to 1, 2, 3 or 4.

Empty packets (length field is set to 0) will not be decrypted but instead moved unmodified through the AES CCM, these packets will always pass the MIC check.

The CCM supports different widths of the LENGTH field in the data structure for decrypted packets. This is configured in the [MODE](#) on page 117 register.

Figure 31: Decryption

### 6.4.4 AES CCM and RADIO concurrent operation

The CCM module is able to encrypt/decrypt data synchronously to data being transmitted or received on the radio.

In order for the CCM module to run synchronously with the radio, the data rate setting in the **MODE** on page 117 register needs to match the radio data rate. The settings in this register apply whenever either the KSGEN or CRYPT tasks are triggered.

The data rate setting of the **MODE** on page 117 register can also be overridden on-the-fly during an ongoing encrypt/decrypt operation by the contents of the **RATEOVERRIDE** on page 119 register. The data rate setting in this register applies whenever the RATEOVERRIDE task is triggered. This feature can be useful in cases where the radio data rate is changed during an ongoing packet transaction.

### 6.4.5 Encrypting packets on-the-fly in radio transmit mode

When the AES CCM is encrypting a packet on-the-fly at the same time as the radio is transmitting it, the radio must read the encrypted packet from the same memory location as the AES CCM is writing to.

The **OUTPTR** on page 118 pointer in the AES CCM must therefore point to the same memory location as the **PACKETPTR** pointer in the radio, see [Configuration of on-the-fly encryption](#) on page 110.

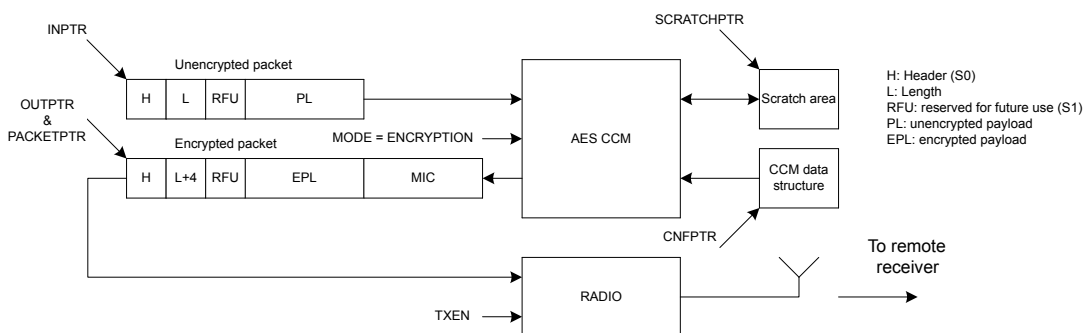

Figure 32: Configuration of on-the-fly encryption

In order to match the RADIO's timing, the KSGEN task must be triggered early enough to allow the key-stream generation to complete before the encryption of the packet shall start.

For short packets (**MODE.LENGTH = Default**) the KSGEN task must be triggered no later than when the **START** task in the RADIO is triggered. In addition the shortcut between the **ENDKSGEN** event and the **CRYPT** task must be enabled. This use-case is illustrated in [On-the-fly encryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 111 using a PPI connection between the **READY** event in the RADIO and the **KSGEN** task in the AES CCM.

For long packets (**MODE.LENGTH = Extended**) the key-stream generation will need to be started even earlier, for example at the time when the **TXEN** task in the RADIO is triggered.

**Important:** Refer to [Timing specification](#) on page 120 for information about the time needed for generating a key-stream.

Figure 33: On-the-fly encryption of short packets (MODE.LENGTH = Default) using a PPI connection

### 6.4.6 Decrypting packets on-the-fly in radio receive mode

When the AES CCM is decrypting a packet on-the-fly at the same time as the RADIO is receiving it, the AES CCM must read the encrypted packet from the same memory location as the RADIO is writing to.

The `INPTR` on page 118 pointer in the AES CCM must therefore point to the same memory location as the `PACKETPTR` pointer in the RADIO, see [Configuration of on-the-fly decryption](#) on page 111.

Figure 34: Configuration of on-the-fly decryption

In order to match the RADIO's timing, the KSGEN task must be triggered early enough to allow the key-stream generation to complete before the decryption of the packet shall start.

For short packets (MODE.LENGTH = Default) the KSGEN task must be triggered no later than when the START task in the RADIO is triggered. In addition, the CRYPT task must be triggered no earlier than when the ADDRESS event is generated by the RADIO.

If the CRYPT task is triggered exactly at the same time as the ADDRESS event is generated by the RADIO, the AES CCM will guarantee that the decryption is completed no later than when the END event in the RADIO is generated.

This use-case is illustrated in [On-the-fly decryption of short packets \(MODE.LENGTH = Default\) using a PPI connection](#) on page 112 using a PPI connection between the ADDRESS event in the RADIO and the CRYPT task in the AES CCM. The KSGEN task is triggered from the READY event in the RADIO through a PPI connection.

For long packets (MODE.LENGTH = Extended) the key-stream generation will need to be started even earlier, for example at the time when the RXEN task in the RADIO is triggered.

**Important:** Refer to [Timing specification](#) on page 120 for information about the time needed for generating a key-stream.

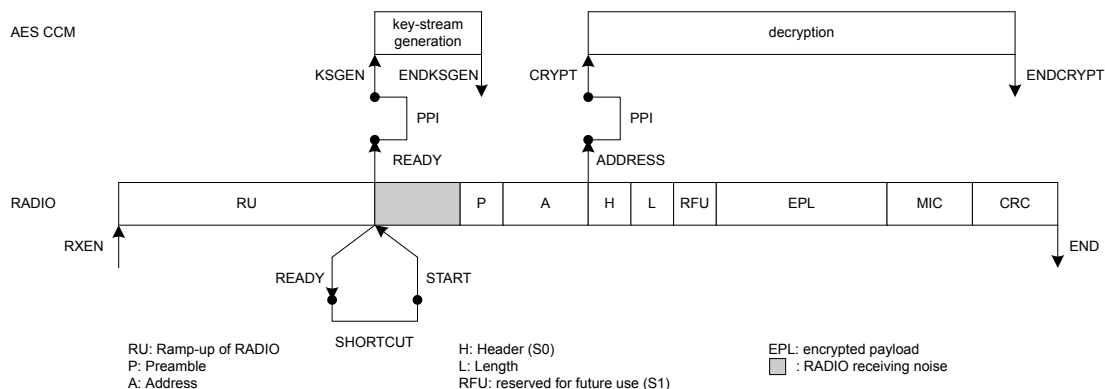

Figure 35: On-the-fly decryption of short packets (`MODE.LENGTH = Default`) using a PPI connection

## 6.4.7 CCM data structure

The CCM data structure is located in Data RAM at the memory location specified by the CNFPTR pointer register.

| Property | Address offset | Description  |
|----------|----------------|--|
| KEY      | 0              | 16 byte AES key  |
| PKTCTR   | 16             | Octet0 (LSO) of packet counter   |
|          | 17             | Octet1 of packet counter   |
|          | 18             | Octet2 of packet counter   |
|          | 19             | Octet3 of packet counter   |
|          | 20             | Bit 6 – Bit 0: Octet4 (7 most significant bits of packet counter, with Bit 6 being the most significant bit) Bit7: Ignored |
|          | 21             | Ignored  |
|          | 22             | Ignored  |
|          | 23             | Ignored  |
|          | 24             | Bit 0: Direction bit Bit 7 – Bit 1: Zero padded  |
| IV       | 25             | 8 byte initialization vector (IV) Octet0 (LSO) of IV, Octet1 of IV, ... , Octet7 (MSO) of IV                               |

Table 27: CCM data structure overview

The NONCE vector (as specified by the *Bluetooth* Core Specification) will be generated by hardware based on the information specified in the CCM data structure from [CCM data structure overview](#) on page 112 .

| Property | Address offset | Description                            |
|----------|----------------|--|
| HEADER   | 0              | Packet Header                          |
| LENGTH   | 1              | Number of bytes in unencrypted payload |
| RFU      | 2              | Reserved Future Use                    |
| PAYLOAD  | 3              | Unencrypted payload                    |

Table 28: Data structure for unencrypted packet

| Property | Address offset     | Description  |
|----------|--------------------|--|
| HEADER   | 0                  | Packet Header  |
| LENGTH   | 1                  | Number of bytes in encrypted payload including length of MIC<br><br><b>Important:</b> LENGTH will be 0 for empty packets since the MIC is not added to empty packets |
| RFU      | 2                  | Reserved Future Use  |
| PAYLOAD  | 3                  | Encrypted payload  |
| MIC      | 3 + payload length | ENCRYPT: 4 bytes encrypted MIC<br><br><b>Important:</b> MIC is not added to empty packets  |

Table 29: Data structure for encrypted packet

## 6.4.8 EasyDMA and ERROR event

The CCM implements an EasyDMA mechanism for reading and writing to the RAM.

In cases where the CPU and other EasyDMA enabled peripherals are accessing the same RAM block at the same time, a high level of bus collisions may cause too slow operation for correct on the fly encryption. In this case the ERROR event will be generated.

The EasyDMA will have finished accessing the RAM when the ENDKSGEN and ENDCRYPT events are generated.

If the CNFPTR, SCRATCHPTR, INPTR and the OUTPTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

## 6.4.9 Registers

| Base address | Peripheral | Instance | Description  | Configuration |
|--------------|------------|----------|--|---------------|
| 0x4000F000   | CCM        | CCM      | AES counter with CBC-MAC (CCM) mode block encryption |               |

Table 30: Instances

| Register           | Offset | Description   |            |
|--------------------|--------|---|------------|
| TASKS_KSGEN        | 0x000  | Start generation of key-stream. This operation will stop by itself when completed.  |            |
| TASKS_CRYPT        | 0x004  | Start encryption/decryption. This operation will stop by itself when completed.   |            |
| TASKS_STOP         | 0x008  | Stop encryption/decryption  |            |
| TASKS_RATEOVERRIDE | 0x00C  | Override DATARATE setting in MODE register with the contents of the RATEOVERRIDE register for any ongoing encryption/decryption |            |
| EVENTS_ENDKSGEN    | 0x100  | Key-stream generation complete  |            |
| EVENTS_ENDCRYPT    | 0x104  | Encrypt/decrypt complete  |            |
| EVENTS_ERROR       | 0x108  | CCM error event   | Deprecated |
| SHORTS             | 0x200  | Shortcuts between local events and tasks  |            |
| INTENSET           | 0x304  | Enable interrupt  |            |
| INTENCLR           | 0x308  | Disable interrupt   |            |
| MICSTATUS          | 0x400  | MIC check result  |            |
| ENABLE             | 0x500  | Enable  |            |
| MODE               | 0x504  | Operation mode  |            |
| CNFPTR             | 0x508  | Pointer to data structure holding AES key and NONCE vector  |            |
| INPTR              | 0x50C  | Input pointer   |            |
| OUTPTR             | 0x510  | Output pointer  |            |

| Register      | Offset | Description   |
|---------------|--------|---|
| SCRATCHPTR    | 0x514  | Pointer to data area used for temporary storage             |
| MAXPACKETSIZE | 0x518  | Length of key-stream generated when MODE.LENGTH = Extended. |
| RATEOVERRIDE  | 0x51C  | Data rate override setting.                                 |

Table 31: Register overview

### 6.4.9.1 TASKS\_KSGEN

Address offset: 0x000

Start generation of key-stream. This operation will stop by itself when completed.

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |             |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 6.4.10 Electrical specification

### 6.4.10.1 Timing specification

| Symbol           | Description   | Min. | Typ. | Max. | Units         |
|------------------|---|------|------|------|---------------|
| $t_{\text{gen}}$ | Time needed for key-stream generation (given priority access to destination RAM block). |      |      | 50   | $\mu\text{s}$ |

## 6.5 COMP — Comparator

The comparator (COMP) compares an input voltage (VIN+) against a second input voltage (VIN-). VIN+ can be derived from an analog input pin (AIN0-AIN7). VIN- can be derived from multiple sources depending on the operation mode of the comparator.

Main features of the comparator are:

- Input range from 0 V to VDD
- Single-ended mode
  - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
  - Configurable hysteresis
- Reference inputs (VREF):
  - VDD
  - External reference from AIN0 to AIN7 (between 0 V and VDD)
  - Internal references 1.2 V, 1.8 V and 2.4 V
- Three speed/power consumption modes: low-power, normal and high-speed
- Event generation on output changes
  - UP event on VIN- > VIN+
  - DOWN event on VIN- < VIN+
  - CROSS event on VIN+ and VIN- crossing
  - READY event on core and internal reference (if used) ready

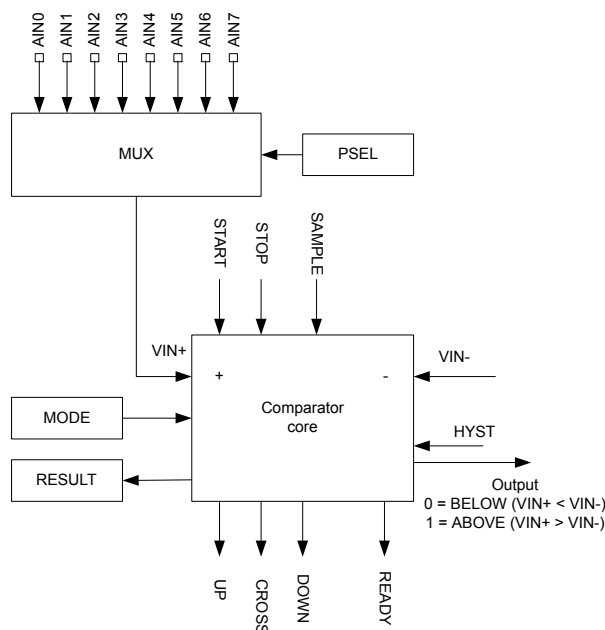

Figure 36: Comparator overview

Once enabled (using the [ENABLE](#) register), the comparator is started by triggering the START task and stopped by triggering the STOP task. The comparator will generate a READY event to indicate when it is ready for use and the output is correct. The delay between START and READY is  $t_{INT\_REF,START}$  if an internal reference is selected, or  $t_{COMP,START}$  if an external reference is used. When the COMP module is started, events will be generated every time VIN+ crosses VIN-.

## Operation modes

The comparator can be configured to operate in two main operation modes, differential mode and single-ended mode. See the [MODE](#) register for more information. In both operation modes, the comparator can operate in different speed and power consumption modes (low-power, normal and high-speed). High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

Use the [PSEL](#) register to select any of the AIN0-AIN7 pins as VIN+ input, regardless of the operation mode selected for the comparator. The source of VIN- depends on which operation mode is used:

- Differential mode: Derived directly from AIN0 to AIN7
- Single-ended mode: Derived from VREF. VREF can be derived from VDD, AIN0-AIN7 or internal 1.2 V, 1.8 V and 2.4 V references.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the [HYST](#) register. In single-ended mode, VUP and VDOWN thresholds can be set to implement a hysteresis using the reference ladder (see [Comparator in single-ended mode](#) on page 123). This hysteresis is in the order of magnitude of  $V_{DIFFHYST}$ , and shall prevent noise on the signal to create unwanted events. See [Hysteresis example where VIN+ starts below VUP](#) on page 124 for illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to [RESULT](#) register by triggering the SAMPLE task.

## 6.5.1 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the differential mode:

- PSEL
- MODE
- EXTREFSEL

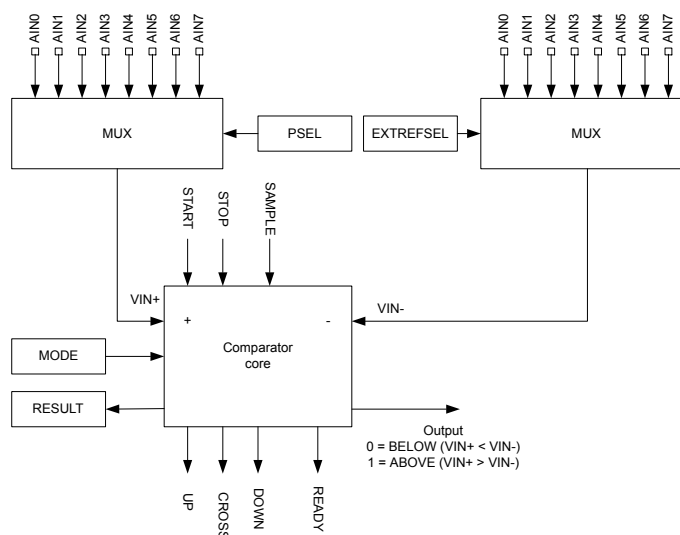

Figure 37: Comparator in differential mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When **HYST** register is turned on while in this mode, the output of the comparator (and associated events) will change from ABOVE to BELOW whenever VIN+ becomes lower than VIN- - ( $V_{DIFFHYST} / 2$ ). It will also change from BELOW to ABOVE whenever VIN+ becomes higher than VIN- + ( $V_{DIFFHYST} / 2$ ). This behavior is illustrated in **Hysteresis enabled in differential mode** on page 122.

Figure 38: Hysteresis enabled in differential mode

## 6.5.2 Single-ended mode

In single-ended mode, VIN- is derived from the reference ladder.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the single-ended mode:

- **PSEL**
- **MODE**
- **REFSEL**
- **EXTREFSEL**
- **TH**

The reference ladder uses the reference voltage (VREF) to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured using THUP and THDOWN respectively in the **TH** register. VREF can be derived from any of the available reference sources, configured using the **EXTREFSEL** and **REFSEL** registers as illustrated in [Comparator in single-ended mode](#) on page 123. When AREF is selected in the **REFSEL** register, the **EXTREFSEL** register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 39: Comparator in single-ended mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When the comparator core detects that  $VIN+ > VIN-$ , i.e. ABOVE as per the **RESULT** register,  $VIN-$  will switch to VDOWN. When  $VIN+$  falls below  $VIN-$  again,  $VIN-$  will be switched back to VUP. By specifying VUP larger than VDOWN, a hysteresis can be generated as illustrated in [Hysteresis example where  \$VIN+\$  starts below VUP](#) on page 124 and [Hysteresis example where  \$VIN+\$  starts above VUP](#) on page 124.

Writing to **HYST** has no effect in single-ended mode, and the content of this register is ignored.

Figure 40: Hysteresis example where  $V_{IN+}$  starts below  $V_{UP}$

Figure 41: Hysteresis example where  $V_{IN+}$  starts above  $V_{UP}$

### 6.5.3 Registers

| Base address | Peripheral | Instance | Description                | Configuration |
|--------------|------------|----------|----------------------------|---------------|
| 0x40013000   | COMP       | COMP     | General purpose comparator |               |

## 6.5.4 Electrical specification

### 6.5.4.1 COMP Electrical Specification

| Symbol                      | Description   | Min. | Typ. | Max. | Units         |
|-----------------------------|---|------|------|------|---------------|
| $t_{\text{PROPDLV,LP}}$     | Propagation delay, low-power mode <sup>1</sup>                  |      | 0.6  |      | $\mu\text{s}$ |
| $t_{\text{PROPDLV,N}}$      | Propagation delay, normal mode <sup>1</sup>                     |      | 0.2  |      | $\mu\text{s}$ |
| $t_{\text{PROPDLV,HS}}$     | Propagation delay, high-speed mode <sup>1</sup>                 |      | 0.1  |      | $\mu\text{s}$ |
| $V_{\text{DIFFHYST}}$       | Optional hysteresis applied to differential input               | 10   | 30   | 90   | mV            |
| $V_{\text{VDD-VREF}}$       | Required difference between VDD and a selected VREF, VDD > VREF | 0.3  |      |      | V             |
| $t_{\text{INT\_REF,START}}$ | Startup time for the internal bandgap reference                 |      | 50   | 80   | $\mu\text{s}$ |
| $E_{\text{INT\_REF}}$       | Internal bandgap reference error                                | -3   |      | 3    | %             |
| $V_{\text{INPUTOFFSET}}$    | Input offset  | -15  |      | 15   | mV            |
| $t_{\text{COMP,START}}$     | Startup time for the comparator core                            |      | 3    |      | $\mu\text{s}$ |

<sup>1</sup> Propagation delay is with 10 mV overdrive.

## 6.6 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

AES ECB operates with EasyDMA access to system Data RAM for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB features:

- 128 bit AES encryption
- Supports standard AES ECB block encryption
- Memory pointer support
- DMA data transfer

AES ECB performs a 128 bit AES block encrypt. At the STARTECB task, data and key is loaded into the algorithm by EasyDMA. When output data has been written back to memory, the ENDECB event is triggered.

AES ECB can be stopped by triggering the STOPECB task.

### 6.6.1 Shared resources

The ECB, CCM, and AAR share the same AES module. The ECB will always have lowest priority and if there is a sharing conflict during encryption, the ECB operation will be aborted and an ERRORECB event will be generated.

### 6.6.2 EasyDMA

The ECB implements an EasyDMA mechanism for reading and writing to the Data RAM. This DMA cannot access the program memory or any other parts of the memory area except RAM.

If the ECBDATAPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

The EasyDMA will have finished accessing the Data RAM when the ENDECB or ERRORECB is generated.

### 6.6.3 ECB data structure

Input to the block encrypt and output from the block encrypt are stored in the same data structure. ECBDATAPTR should point to this data structure before STARTECB is initiated.

| Property   | Address offset | Description                         |
|------------|----------------|-------------------------------------|
| KEY        | 0              | 16 byte AES key                     |
| CLEARTEXT  | 16             | 16 byte AES cleartext input block   |
| CIPHERTEXT | 32             | 16 byte AES ciphertext output block |

Table 34: ECB data structure overview

## 6.6.4 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---|---------------|
| 0x4000E000   | ECB        | ECB      | AES electronic code book (ECB) mode<br>block encryption |               |

Table 35: Instances

| Register        | Offset | Description  |
|-----------------|--------|--|
| TASKS_STARTECB  | 0x000  | Start ECB block encrypt  |
| TASKS_STOPECB   | 0x004  | Abort a possible executing ECB operation                               |
| EVENTS_ENDECB   | 0x100  | ECB block encrypt complete   |
| EVENTS_ERRORECB | 0x104  | ECB block encrypt aborted because of a STOPECB task or due to an error |
| INTENSET        | 0x304  | Enable interrupt   |
| INTENCLR        | 0x308  | Disable interrupt  |
| ECBDATAPTR      | 0x504  | ECB block encrypt memory pointers                                      |

Table 36: Register overview

### 6.6.4.1 TASKS\_STARTECB

Address offset: 0x000

Start ECB block encrypt

If a crypto operation is already running in the AES core, the STARTECB task will not start a new encryption and an ERRORECB event will be triggered

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |                |         |    |       |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |

## 6.6.5 Electrical specification

### 6.6.5.1 ECB Electrical Specification

| Symbol    | Description                             | Min. | Typ. | Max. | Units   |
|-----------|---|------|------|------|---------|
| $t_{ECB}$ | Run time per 16 byte block in all modes |      |      | 7.2  | $\mu$ s |

## 6.7 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of EGU implements a set of tasks which can individually be triggered to generate the corresponding event. For example, the corresponding event for `TASKS_TRIGGER[n]` is `EVENTS_TRIGGERED[n]`. See [Instances](#) on page 136 for a list of EGU instances.

## 6.7.1 Registers

| Base address | Peripheral | Instance | Description            | Configuration |
|--------------|------------|----------|------------------------|---------------|
| 0x40014000   | EGU        | EGU0     | Event generator unit 0 |               |
| 0x40015000   | EGU        | EGU1     | Event generator unit 1 |               |
| 0x40016000   | EGU        | EGU2     | Event generator unit 2 |               |
| 0x40017000   | EGU        | EGU3     | Event generator unit 3 |               |
| 0x40018000   | EGU        | EGU4     | Event generator unit 4 |               |
| 0x40019000   | EGU        | EGU5     | Event generator unit 5 |               |

Table 37: Instances

| Register             | Offset | Description  |
|----------------------|--------|--|
| TASKS_TRIGGER[0]     | 0x000  | Trigger 0 for triggering the corresponding TRIGGERED[0] event              |
| TASKS_TRIGGER[1]     | 0x004  | Trigger 1 for triggering the corresponding TRIGGERED[1] event              |
| TASKS_TRIGGER[2]     | 0x008  | Trigger 2 for triggering the corresponding TRIGGERED[2] event              |
| TASKS_TRIGGER[3]     | 0x00C  | Trigger 3 for triggering the corresponding TRIGGERED[3] event              |
| TASKS_TRIGGER[4]     | 0x010  | Trigger 4 for triggering the corresponding TRIGGERED[4] event              |
| TASKS_TRIGGER[5]     | 0x014  | Trigger 5 for triggering the corresponding TRIGGERED[5] event              |
| TASKS_TRIGGER[6]     | 0x018  | Trigger 6 for triggering the corresponding TRIGGERED[6] event              |
| TASKS_TRIGGER[7]     | 0x01C  | Trigger 7 for triggering the corresponding TRIGGERED[7] event              |
| TASKS_TRIGGER[8]     | 0x020  | Trigger 8 for triggering the corresponding TRIGGERED[8] event              |
| TASKS_TRIGGER[9]     | 0x024  | Trigger 9 for triggering the corresponding TRIGGERED[9] event              |
| TASKS_TRIGGER[10]    | 0x028  | Trigger 10 for triggering the corresponding TRIGGERED[10] event            |
| TASKS_TRIGGER[11]    | 0x02C  | Trigger 11 for triggering the corresponding TRIGGERED[11] event            |
| TASKS_TRIGGER[12]    | 0x030  | Trigger 12 for triggering the corresponding TRIGGERED[12] event            |
| TASKS_TRIGGER[13]    | 0x034  | Trigger 13 for triggering the corresponding TRIGGERED[13] event            |
| TASKS_TRIGGER[14]    | 0x038  | Trigger 14 for triggering the corresponding TRIGGERED[14] event            |
| TASKS_TRIGGER[15]    | 0x03C  | Trigger 15 for triggering the corresponding TRIGGERED[15] event            |
| EVENTS_TRIGGERED[0]  | 0x100  | Event number 0 generated by triggering the corresponding TRIGGER[0] task   |
| EVENTS_TRIGGERED[1]  | 0x104  | Event number 1 generated by triggering the corresponding TRIGGER[1] task   |
| EVENTS_TRIGGERED[2]  | 0x108  | Event number 2 generated by triggering the corresponding TRIGGER[2] task   |
| EVENTS_TRIGGERED[3]  | 0x10C  | Event number 3 generated by triggering the corresponding TRIGGER[3] task   |
| EVENTS_TRIGGERED[4]  | 0x110  | Event number 4 generated by triggering the corresponding TRIGGER[4] task   |
| EVENTS_TRIGGERED[5]  | 0x114  | Event number 5 generated by triggering the corresponding TRIGGER[5] task   |
| EVENTS_TRIGGERED[6]  | 0x118  | Event number 6 generated by triggering the corresponding TRIGGER[6] task   |
| EVENTS_TRIGGERED[7]  | 0x11C  | Event number 7 generated by triggering the corresponding TRIGGER[7] task   |
| EVENTS_TRIGGERED[8]  | 0x120  | Event number 8 generated by triggering the corresponding TRIGGER[8] task   |
| EVENTS_TRIGGERED[9]  | 0x124  | Event number 9 generated by triggering the corresponding TRIGGER[9] task   |
| EVENTS_TRIGGERED[10] | 0x128  | Event number 10 generated by triggering the corresponding TRIGGER[10] task |
| EVENTS_TRIGGERED[11] | 0x12C  | Event number 11 generated by triggering the corresponding TRIGGER[11] task |
| EVENTS_TRIGGERED[12] | 0x130  | Event number 12 generated by triggering the corresponding TRIGGER[12] task |
| EVENTS_TRIGGERED[13] | 0x134  | Event number 13 generated by triggering the corresponding TRIGGER[13] task |
| EVENTS_TRIGGERED[14] | 0x138  | Event number 14 generated by triggering the corresponding TRIGGER[14] task |
| EVENTS_TRIGGERED[15] | 0x13C  | Event number 15 generated by triggering the corresponding TRIGGER[15] task |
| INTEN                | 0x300  | Enable or disable interrupt  |
| INTENSET             | 0x304  | Enable interrupt   |
| INTENCLR             | 0x308  | Disable interrupt  |

Table 38: Register overview

### 6.7.1.1 TASKS\_TRIGGER[n] (n=0..15)

Address offset: 0x000 + (n × 0x4)

Trigger n for triggering the corresponding TRIGGERED[n] event

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |          |       |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 6.7.2 Electrical specification

### 6.7.2.1 EGU Electrical Specification

| Symbol               | Description   | Min. | Typ. | Max. | Units  |
|----------------------|---|------|------|------|--------|
| $t_{\text{EGU,EVT}}$ | Latency between setting an EGU event flag and the system setting an interrupt |      | 1    |      | cycles |

## 6.8 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports, with each port having up to 32 GPIOs.

The number of ports and GPIOs per port varies with product variant and package. Refer to [Registers](#) on page 141 and [Pin assignments](#) on page 557 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through the PPI and GPIOTE channels
- Any pin can be mapped to a peripheral for layout flexibility
- GPIO state changes captured on the SENSE signal can be stored by the LATCH register

The GPIO port peripheral implements up to 32 pins,  $\text{PIN}_0$  through  $\text{PIN}_{31}$ . Each of these pins can be individually configured in the  $\text{PIN\_CNF}[n]$  registers ( $n=0..31$ ).

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect

- Analog input (for selected pins)

The PIN\_CNF registers are retained registers. See [POWER — Power supply](#) on page 58 for more information about retained registers.

### 6.8.1 Pin configuration

Pins can be individually configured through the SENSE field in the PIN\_CNF[n] register to detect either a high or low level input.

When the correct level is detected on a configured pin, the sense mechanism will set the DETECT signal high. Each pin has a separate DETECT signal. Default behavior, defined by the DETECTMODE register, combines all DETECT signals from the pins in the GPIO port into one common DETECT signal and routes it through the system to be utilized by other peripherals. This mechanism is functional in both System ON and System OFF mode. See [GPIO port and the GPIO pin details](#) on page 139.

The following figure illustrates the GPIO port containing 32 individual pins, where PIN0 is shown in more detail for reference. All signals on the left side of the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Figure 42: GPIO port and the GPIO pin details

Pins should be in a level that cannot trigger the sense mechanism before being enabled. If the SENSE condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled, the DETECT signal will immediately go high. A PORT event is triggered if the DETECT signal was low before enabling the sense mechanism. See [GPIO — GPIO tasks and events](#) on page 146.

See the following peripherals for more information about how the DETECT signal is used:

- [POWER — Power supply](#) on page 58 - uses the DETECT signal to exit from System OFF mode.
- [GPIO — GPIO tasks and events](#) on page 146 - uses the DETECT signal to generate the PORT event.

When a pin's PINx.DETECT signal goes high, a flag is set in the LATCH register. For example, when the PIN0.DETECT signal goes high, bit 0 in the LATCH register is set to 1. If the CPU performs a clear operation on a bit in the LATCH register, when the associated PINx.DETECT signal is high, the bit in the LATCH register will not be cleared. The LATCH register will only be cleared if the CPU explicitly clears it by writing a 1 to the bit that shall be cleared, i.e. the LATCH register will not be affected by a PINx.DETECT signal being set low.

The LDETECT signal will be set high when one or more bits in the LATCH register are 1. The LDETECT signal will be set low when all bits in the LATCH register are successfully cleared to 0.

If one or more bits in the LATCH register are 1 after the CPU has performed a clear operation on the LATCH register, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 140.

**Note:** The CPU can read the LATCH register at any time to check if a SENSE condition has been met on any of the GPIO pins. This is still valid if that condition is no longer met at the time the CPU queries the LATCH register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register. It is possible to change from default behavior to the DETECT signal that is derived directly from the LDETECT signal. See [GPIO port and the GPIO pin details](#) on page 139. The following figure illustrates the DETECT signal behavior for these two alternatives.

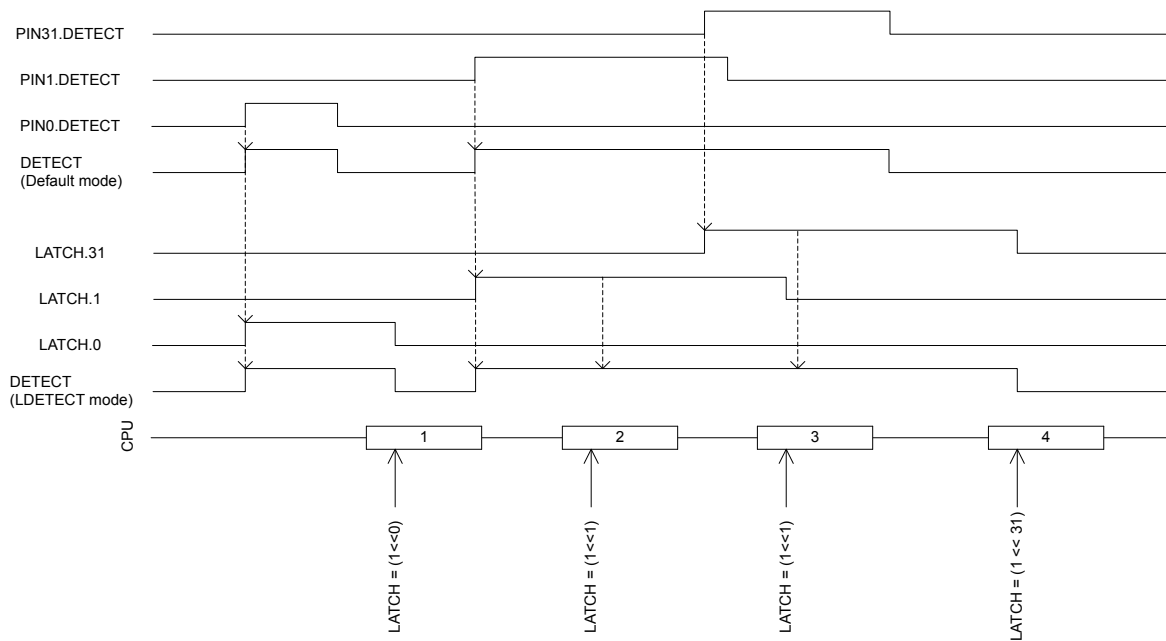

Figure 43: DETECT signal behavior

A GPIO pin input buffer can be disconnected from the pin to enable power savings when the pin is not used as an input, see [GPIO port and the GPIO pin details](#) on page 139. Input buffers must be connected to get a valid input value in the IN register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [GPIO port and the GPIO pin details](#) on page 139.

Selected pins also support analog input signals, see ANAIN in [GPIO port and the GPIO pin details](#) on page 139. The assignment of the analog pins can be found in [Pin assignments](#) on page 557.

**Note:** When a pin is configured as digital input, increased current consumption occurs when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . It is good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

## 6.8.2 Registers

| Base address | Peripheral | Instance | Description                              | Configuration              |
|--------------|------------|----------|--|----------------------------|
| 0x50000000   | GPIO       | GPIO     | General purpose input and output         | Deprecated                 |
| 0x50000000   | GPIO       | P0       | General purpose input and output, port 0 | P0.00 to P0.31 implemented |
| 0x50000300   | GPIO       | P1       | General purpose input and output, port 1 | P1.00 to P1.09 implemented |

### 6.8.3.2 NFC Pads Electrical Specification

| Symbol               | Description  | Min. | Typ. | Max. | Units   |
|----------------------|--|------|------|------|---------|
| $C_{PAD\_NFC}$       | Pad capacitance on NFC pads  |      | 4    |      | pF      |
| $I_{NFC\_LEAK}$      | Leakage current between NFC pads when driven to different states                             |      | 1    | 10   | $\mu$ A |
| $I_{NFC\_LEAK\_EXT}$ | Leakage current between NFC pads when driven to different states, extended temperature range |      | 1    | 15   | $\mu$ A |

## 6.9 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Tasks and events are briefly introduced in [Peripheral interface](#) on page 96, and GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 138.

Low power detection of pin state changes is possible when in System ON or System OFF.

| Instance | Number of GPIOTE channels |
|----------|---------------------------|
| GPIOTE   | 8                         |

Table 41: GPIOTE properties

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

<sup>14</sup> Rise and fall times based on simulations

## 6.9.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks SET[n], CLR[n], and OUT[n] can write to individual pins, and events IN[n] can be generated from input changes of individual pins.

The SET task will set the pin selected in GPIOTE.CONFIG[n].PSEL to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in CONFIG[n].POLARITY. It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the CONFIG[n] registers. One CONFIG[n] register is associated with a set of SET[n], CLR[n], and OUT[n] tasks and IN[n] events.

As long as a SET[n], CLR[n], and OUT[n] task or an IN[n] event is configured to control pin **n**, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see MODE field in CONFIG[n] register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

Table 42: Task priorities

When setting the CONFIG[n] registers, MODE=Disabled does not have the same effect as MODE=Task and POLARITY=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the OUTINIT field of CONFIG[n].

## 6.9.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 138 for more information about the DETECT signal.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the PINx.DETECT signals is still high, for example. See [Pin configuration](#) on page 139 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature is always enabled even if the peripheral itself appears to be IDLE, meaning no clocks or other power intensive infrastructure have to be requested to keep this feature enabled. This feature can therefore be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the following must be performed:

1. Disable interrupts on the PORT event (through INTENCLR.PORT).
2. Configure the sources (PIN\_CNF[n].SENSE).
3. Clear any potential event that could have occurred during configuration (write '0' to EVENTS\_PORT).
4. Enable interrupts (through INTENSET.PORT).

### 6.9.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the CONFIG.PSEL field.

When Event mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an input, overriding the DIR setting in GPIO. Similarly, when Task mode is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will be configured as an output overriding the DIR setting and OUT value in GPIO. When Disabled is selected in CONFIG.MODE, the pin specified by CONFIG.PSEL will use its configuration from the PIN[n].CNF registers in GPIO.

**Note:** A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

### 6.9.4 Registers

| Base address | Peripheral | Instance | Description           | Configuration |
|--------------|------------|----------|-----------------------|---------------|
| 0x40006000   | GPIOTE     | GPIOTE   | GPIO tasks and events |               |

Table 43: Instances

| Register     | Offset | Description   |
|--------------|--------|---|
| TASKS_OUT[0] | 0x000  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is configured in CONFIG[0].POLARITY. |
| TASKS_OUT[1] | 0x004  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is configured in CONFIG[1].POLARITY. |
| TASKS_OUT[2] | 0x008  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is configured in CONFIG[2].POLARITY. |
| TASKS_OUT[3] | 0x00C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is configured in CONFIG[3].POLARITY. |
| TASKS_OUT[4] | 0x010  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is configured in CONFIG[4].POLARITY. |
| TASKS_OUT[5] | 0x014  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is configured in CONFIG[5].POLARITY. |
| TASKS_OUT[6] | 0x018  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is configured in CONFIG[6].POLARITY. |
| TASKS_OUT[7] | 0x01C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is configured in CONFIG[7].POLARITY. |
| TASKS_SET[0] | 0x030  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[1] | 0x034  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[2] | 0x038  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[3] | 0x03C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[4] | 0x040  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[5] | 0x044  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[6] | 0x048  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is to set it high.                   |
| TASKS_SET[7] | 0x04C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is to set it high.                   |
| TASKS_CLR[0] | 0x060  | Task for writing to pin specified in CONFIG[0].PSEL. Action on pin is to set it low.                    |
| TASKS_CLR[1] | 0x064  | Task for writing to pin specified in CONFIG[1].PSEL. Action on pin is to set it low.                    |
| TASKS_CLR[2] | 0x068  | Task for writing to pin specified in CONFIG[2].PSEL. Action on pin is to set it low.                    |

| Register     | Offset | Description  |
|--------------|--------|--|
| TASKS_CLR[3] | 0x06C  | Task for writing to pin specified in CONFIG[3].PSEL. Action on pin is to set it low. |
| TASKS_CLR[4] | 0x070  | Task for writing to pin specified in CONFIG[4].PSEL. Action on pin is to set it low. |
| TASKS_CLR[5] | 0x074  | Task for writing to pin specified in CONFIG[5].PSEL. Action on pin is to set it low. |
| TASKS_CLR[6] | 0x078  | Task for writing to pin specified in CONFIG[6].PSEL. Action on pin is to set it low. |
| TASKS_CLR[7] | 0x07C  | Task for writing to pin specified in CONFIG[7].PSEL. Action on pin is to set it low. |
| EVENTS_IN[0] | 0x100  | Event generated from pin specified in CONFIG[0].PSEL                                 |
| EVENTS_IN[1] | 0x104  | Event generated from pin specified in CONFIG[1].PSEL                                 |
| EVENTS_IN[2] | 0x108  | Event generated from pin specified in CONFIG[2].PSEL                                 |
| EVENTS_IN[3] | 0x10C  | Event generated from pin specified in CONFIG[3].PSEL                                 |
| EVENTS_IN[4] | 0x110  | Event generated from pin specified in CONFIG[4].PSEL                                 |
| EVENTS_IN[5] | 0x114  | Event generated from pin specified in CONFIG[5].PSEL                                 |
| EVENTS_IN[6] | 0x118  | Event generated from pin specified in CONFIG[6].PSEL                                 |
| EVENTS_IN[7] | 0x11C  | Event generated from pin specified in CONFIG[7].PSEL                                 |
| EVENTS_PORT  | 0x17C  | Event generated from multiple input GPIO pins with SENSE mechanism enabled           |
| INTENSET     | 0x304  | Enable interrupt   |
| INTENCLR     | 0x308  | Disable interrupt  |
| CONFIG[0]    | 0x510  | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                   |
| CONFIG[1]    | 0x514  | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                   |
| CONFIG[2]    | 0x518  | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                   |
| CONFIG[3]    | 0x51C  | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                   |
| CONFIG[4]    | 0x520  | Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event                   |

|                  |             | High  | 1       | Task mode: Initial value of pin before task triggering is high  |  |  |  |  |  |  |  |  |  |  |  |  |  |                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |     |  |

## 6.9.5 Electrical specification

## 6.10 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bi-directional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format
- 8, 16 and 24-bit sample width
- Low-jitter Master Clock generator
- Various sample rates

Figure 44: I<sup>2</sup>S master

### 6.10.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (Master or Slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the Master to the Slave.

### 6.10.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 166 and [CONFIG.RXEN](#) on page 166.

Transmission and/or reception is started by triggering the START task. When started and transmission is enabled (in [CONFIG.TXEN](#) on page 166), the TXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 169 number of transmitted data words (containing one or more samples). Similarly, when started and reception is enabled (in [CONFIG.RXEN](#) on page 166), the RXPTRUPD event will be generated for every [RXTXD.MAXCNT](#) on page 169 received data words.

Figure 45: Transmitting and receiving. *CONFIG.FORMAT = Aligned, CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo, RXTXD.MAXCNT = 1.*

### 6.10.3 Left right clock (LRCK)

The Left Right Clock (LRCK), often referred to as "word clock", "sample clock" or "word select" in I<sup>2</sup>S context, is the clock defining the frames in the serial bit streams sent and received on SDOUT and SDIN, respectively.

In I2S mode, each frame contains one left and right sample pair, with the left sample being transferred during the low half period of LRCK followed by the right sample being transferred during the high period of LRCK.

In Aligned mode, each frame contains one left and right sample pair, with the left sample being transferred during the high half period of LRCK followed by the right sample being transferred during the low period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 6.10.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

When operating in Master mode the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$\text{SCK} = 2 * \text{LRCK} * \text{CONFIG.SWIDTH}$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode SCK is provided by the external I<sup>2</sup>S master.

## 6.10.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The MCK is generated by an internal MCK generator. This generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in slave mode can be useful in the case where the external Master is not able to generate its own master clock.

The MCK generator is enabled/disabled in the register `CONFIG.MCKEN` on page 166, and the generator is started or stopped by the START or STOP tasks.

In Master mode the LRCK and the SCK frequencies are closely related, as both are derived from MCK and set indirectly through `CONFIG.RATIO` on page 167 and `CONFIG.SWIDTH` on page 168.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. SCK frequency can never exceed the MCK frequency, which can be formulated as:

$$\text{CONFIG.RATIO} \geq 2 * \text{CONFIG.SWIDTH}$$

2. The MCK/LRCK ratio shall be a multiple of  $2 * \text{CONFIG.SWIDTH}$ , which can be formulated as:

$$\text{Integer} = (\text{CONFIG.RATIO} / (2 * \text{CONFIG.SWIDTH}))$$

The MCK signal can be routed to an output pin (specified in `PSEL.MCK`) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

Figure 46: Relation between RATIO, MCK and LRCK.

| Desired LRCK [Hz] | CONFIG.SWID | CONFIG.RATIO | CONFIG.MCKF | MCK [Hz]  | LRCK [Hz] | LRCK error [%] |
|-------------------|-------------|--------------|-------------|-----------|-----------|----------------|
| 16000             | 16Bit       | 32X          | 32MDIV63    | 507936.5  | 15873.0   | -0.8           |
| 16000             | 16Bit       | 64X          | 32MDIV31    | 1032258.1 | 16129.0   | 0.8            |
| 16000             | 16Bit       | 256X         | 32MDIV8     | 4000000.0 | 15625.0   | -2.3           |
| 32000             | 16Bit       | 32X          | 32MDIV31    | 1032258.1 | 32258.1   | 0.8            |
| 32000             | 16Bit       | 64X          | 32MDIV16    | 2000000.0 | 31250.0   | -2.3           |
| 44100             | 16Bit       | 32X          | 32MDIV23    | 1391304.3 | 43478.3   | -1.4           |
| 44100             | 16Bit       | 64X          | 32MDIV11    | 2909090.9 | 45454.5   | 3.1            |

Table 45: Configuration examples

## 6.10.6 Width, alignment and format

The `CONFIG.SWIDTH` register primarily defines the sample width of the data written to memory. In master mode, it then also sets the amount of bits per frame. In Slave mode it controls padding/trimming if required. Left, right, transmitted, and received samples always have the same width. The `CONFIG.FORMAT`

register specifies the position of the data frames with respect to the LRCK edges in both Master and Slave modes.

When using  $I^2S$  format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge. When using Aligned mode, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge.

For data being received on SDIN the sample value can be either right or left-aligned inside a half-frame, as specified in [CONFIG.ALIGN](#) on page 168. [CONFIG.ALIGN](#) on page 168 affects only the decoding of the incoming samples (SDIN), while the outgoing samples (SDOUT) are always left-aligned (or justified).

When using left-alignment, each half-frame starts with the MSB of the sample value (both for data being sent on SDOUT and received on SDIN).

When using right-alignment, each half-frame of data being received on SDIN ends with the LSB of the sample value, while each half-frame of data being sent on SDOUT starts with the MSB of the sample value (same as for left-alignment).

In Master mode, the size of a half-frame (in number of SCK periods) equals the sample width (in number of bits), and in this case the alignment setting does not care as each half-frame in any case will start with the MSB and end with the LSB of the sample value.

In slave mode, however, the sample width does not need to equal the frame size. This means you might have extra or fewer SCK pulses per half-frame than what the sample width specified in [CONFIG.SWIDTH](#) requires.

In the case where we use **left-alignment** and the number of SCK pulses per half-frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits after the LSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0.

In the case where we use **left-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In the case where we use **right-alignment** and the number of SCK pulses per frame is **higher** than the sample width, the following will apply:

- For data received on SDIN, all bits before the MSB of the sample value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the sample value will be 0 (same behavior as for left-alignment).

In the case where we use **right-alignment** and the number of SCK pulses per frame is **lower** than the sample width, the following will apply:

- Data received on SDIN will be sign-extended to "sample width" number of bits before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

Figure 47:  $I^2S$  format. [CONFIG.SWIDTH](#) equalling half-frame size.

Figure 48: Aligned format. *CONFIG.SWIDTH* equalling half-frame size.

### 6.10.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 169 and [RXD.PTR](#) on page 169. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 166 and [CONFIG.RXEN](#) on page 166.

The addresses written to the pointer registers [TXD.PTR](#) on page 169 and [RXD.PTR](#) on page 169 are double-buffered in hardware, and these double buffers are updated for every [RXTXD.MAXCNT](#) on page 169 words (containing one or more samples) read/written from/to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 169 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 169 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 19 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 169 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in a number of 32-bit words. Such a 32-bit memory word can either contain four 8-bit samples, two 16-bit samples or one right-aligned 24-bit sample sign extended to 32 bit.

In stereo mode ([CONFIG.CHANNELS](#)=Stereo), the samples are stored as "left and right sample pairs" in memory. Figure [Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#) on page 158, [Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#) on page 158 and [Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.](#) on page 159 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In mono mode ([CONFIG.CHANNELS](#)=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. Illustrations [Memory mapping for 8 bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#) on page 158, [Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.](#) on page 158 and [Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.](#) on page 159 show how RX samples are mapped to memory in this mode.

For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

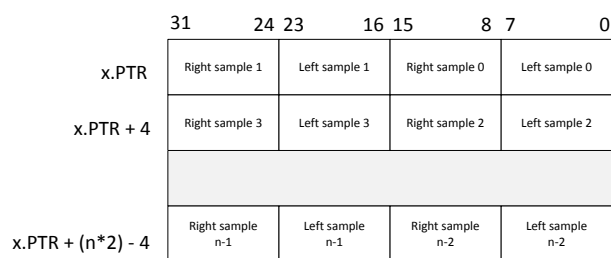

Figure 49: Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.

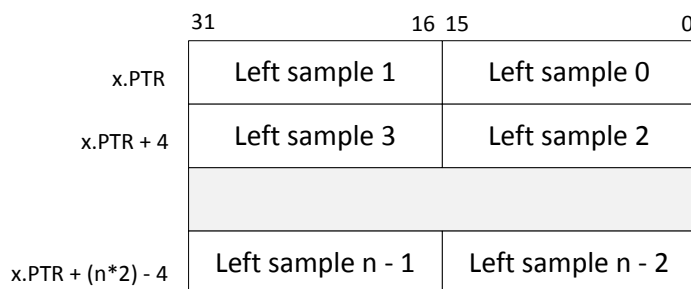

Figure 52: Memory mapping for 16 bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.

Figure 53: Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.

Figure 54: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.

### 6.10.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

## 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```

// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;

```

## 2. Map IO pins using the PINSEL registers

```

// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                     (I2S_PSEL_LRCK_CONNECT_Connected <<
                      I2S_PSEL_LRCK_CONNECT_Pos);

// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<
                       I2S_PSEL_SDOUT_CONNECT_Pos);

// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                     (I2S_PSEL_SDIN_CONNECT_Connected <<
                      I2S_PSEL_SDIN_CONNECT_Pos);

```

### 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```
NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;
```

### 4. Enable the I<sup>2</sup>S module using the ENABLE register

```
NRF_I2S->ENABLE = 1;
```

### 5. Start audio streaming using the START task

```
NRF_I2S->TASKS_START = 1;
```

### 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```
if (NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if (NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}
```

## 6.10.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 165.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [GPIO configuration before enabling peripheral \(master mode\)](#) on page 161 and [GPIO configuration before enabling peripheral \(slave mode\)](#) on page 162.

To secure correct signal levels on the pins when the system is in OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Output    | 0              |         |
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 46: GPIO configuration before enabling peripheral (master mode)

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 47: GPIO configuration before enabling peripheral (slave mode)

## 6.10.10 Registers

| Base address | Peripheral | Instance | Description              | Configuration |
|--------------|------------|----------|--------------------------|---------------|
| 0x40025000   | I2S        | I2S      | Inter-IC sound interface |               |

Table 48: Instances

| Register        | Offset | Description   |
|-----------------|--------|---|
| TASKS_START     | 0x000  | Starts continuous I2S transfer. Also starts MCK generator when this is enabled.   |
| TASKS_STOP      | 0x004  | Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the STOPPED event to be generated.  |
| EVENTS_RXPTRUPD | 0x104  | The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words that are received on the SDIN pin. |
| EVENTS_STOPPED  | 0x108  | I2S transfer stopped.   |
| EVENTS_TXPTRUPD | 0x114  | The TDX.PTR register has been copied to internal double-buffers. When the I2S module is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT words that are sent on the SDOUT pin.    |
| INTEN           | 0x300  | Enable or disable interrupt   |
| INTENSET        | 0x304  | Enable interrupt  |
| INTENCLR        | 0x308  | Disable interrupt   |
| ENABLE          | 0x500  | Enable I2S module.  |
| CONFIG.MODE     | 0x504  | I2S mode.   |
| CONFIG.RXEN     | 0x508  | Reception (RX) enable.  |
| CONFIG.TXEN     | 0x50C  | Transmission (TX) enable.   |
| CONFIG.MCKEN    | 0x510  | Master clock generator enable.  |
| CONFIG.MCKFREQ  | 0x514  | Master clock generator frequency.   |
| CONFIG.RATIO    | 0x518  | MCK / LRCK ratio.   |
| CONFIG.SWIDTH   | 0x51C  | Sample width.   |
| CONFIG.ALIGN    | 0x520  | Alignment of sample within a frame.   |
| CONFIG.FORMAT   | 0x524  | Frame format.   |
| CONFIG.CHANNELS | 0x528  | Enable channels.  |
| RXD.PTR         | 0x538  | Receive buffer RAM start address.   |
| TXD.PTR         | 0x540  | Transmit buffer RAM start address.  |
| RXTXD.MAXCNT    | 0x550  | Size of RXD and TXD buffers.  |
| PSEL.MCK        | 0x560  | Pin select for MCK signal.  |
| PSEL.SCK        | 0x564  | Pin select for SCK signal.  |
| PSEL.LRCK       | 0x568  | Pin select for LRCK signal.   |
| PSEL.SDIN       | 0x56C  | Pin select for SDIN signal.   |
| PSEL.SDOUT      | 0x570  | Pin select for SDOUT signal.  |

Table 49: Register overview

### 6.10.10.1 TASKS\_START

Address offset: 0x000

Starts continuous I2S transfer. Also starts MCK generator when this is enabled.

| Bit number       | 31  | 30          | 29       | 28    | 27  | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
|------------------|---|-------------|----------|-------|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| ID               |   |             |          |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |             |          |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce  | Field       | Value ID | Value | Description   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| A                | W   | TASKS_START |          |       | Starts continuous I2S transfer. Also starts MCK generator when this is enabled. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
|                  |   |             | Trigger  | 1     | Trigger task  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |

### 6.10.10.2 TASKS\_STOP

Address offset: 0x004

Stops I2S transfer. Also stops MCK generator. Triggering this task will cause the STOPPED event to be generated.

| Bit number       | 31  | 30         | 29       | 28    | 27   | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
|------------------|---|------------|----------|-------|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|

## 6.10.11 Electrical specification

### 6.10.11.1 I2S timing specification

| Symbol           | Description                        | Min. | Typ. | Max. | Units |
|------------------|------------------------------------|------|------|------|-------|
| $t_{s\_SDIN}$    | SDIN setup time before SCK rising  | 20   |      |      | ns    |
| $t_{H\_SDIN}$    | SDIN hold time after SCK rising    | 15   |      |      | ns    |
| $t_{s\_SDOUT}$   | SDOUT setup time after SCK falling | 40   |      |      | ns    |
| $t_{H\_SDOUT}$   | SDOUT hold time before SCK falling | 6    |      |      | ns    |
| $t_{SCK\_LRCK}$  | SCLK falling to LRCK edge          | -5   | 0    | 5    | ns    |
| $f_{MCK}$        | MCK frequency                      |      |      | 4000 | kHz   |
| $f_{LRCK}$       | LRCK frequency                     |      |      | 48   | kHz   |
| $f_{SCK}$        | SCK frequency                      |      |      | 2000 | kHz   |
| DC <sub>CK</sub> | Clock duty cycle (MCK, LRCK, SCK)  | 45   |      | 55   | %     |

Figure 55: I2S timing diagram

## 6.11 LPCOMP — Low-power comparator

Low-power comparator (LPCOMP) compares an input voltage against a reference voltage.

Listed here are the main features of LPCOMP:

- 0 - VDD input range
- Ultra-low power
- Eight input options (**AIN0** to **AIN7**)
- Reference voltage options:
  - Two external analog reference inputs, or
  - 15-level internal reference ladder (VDD/16)
- Optional hysteresis enable on input
- Can be used as a wakeup source from System OFF mode

In System ON, the LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin as being above or below the selected reference. The block can be configured to use any of the analog inputs on the device. Additionally, the low-power comparator can be used as an analog wakeup source from System OFF or System ON. The comparator threshold can be programmed to a range of fractions of the supply voltage.

**Note:** LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

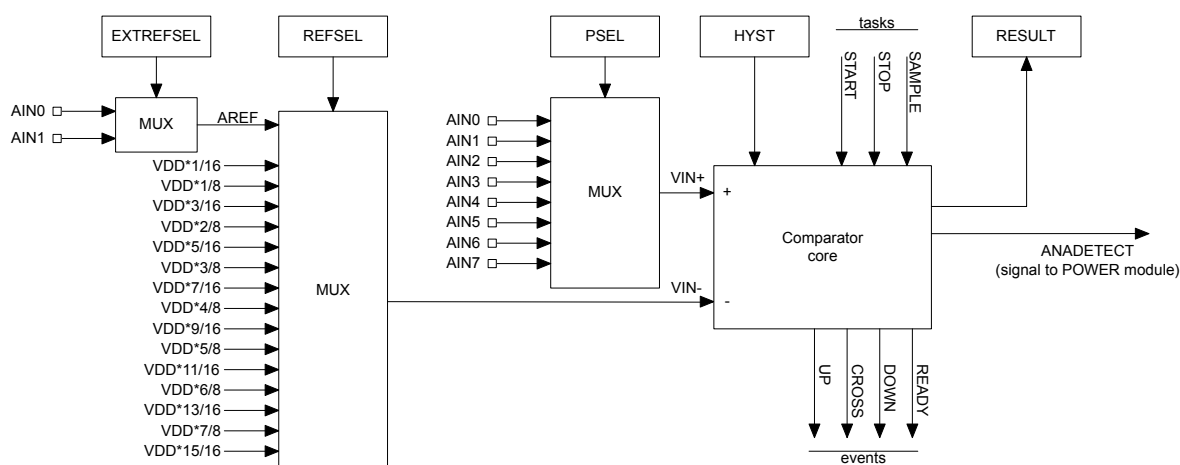

Figure 56: Low-power comparator

The wakeup comparator (LPCOMP) compares an input voltage (VIN+), which comes from an analog input pin selected via the PSEL register, against a reference voltage (VIN-) selected via registers REFSEL on page 178 and EXTREFSEL.

The PSEL, REFSEL, and EXTREFSEL registers must be configured before the LPCOMP is enabled through the ENABLE register.

The HYST register allows enabling an optional hysteresis in the comparator core. This hysteresis shall prevent noise on the signal to create unwanted events. Figure below illustrates the effect of an active hysteresis on a noisy input signal. It is disabled by default, and shall be configured before enabling LPCOMP as well.

Figure 57: Effect of hysteresis on a noisy input signal

The LPCOMP is started by triggering the START task. After a startup time of  $t_{LPCOMP,STARTUP}$ , the LPCOMP will generate a READY event to indicate that the comparator is ready to use and the output of the LPCOMP is correct. The LPCOMP will generate events every time  $VIN+$  crosses  $VIN-$ . More specifically, every time  $VIN+$  rises above  $VIN-$  (upward crossing) an UP event is generated along with a CROSS event. Every time  $VIN+$  falls below  $VIN-$  (downward crossing), a DOWN event is generated along with a CROSS event. When hysteresis is enabled, the upward crossing level becomes  $(VIN- + VHYST/2)$ , and the downward crossing level becomes  $(VIN- - VHYST/2)$ .

The LPCOMP is stopped by triggering the STOP task.

LPCOMP will be operational in both System ON and System OFF mode when it is enabled through the ENABLE register. See [POWER — Power supply](#) on page 58 for more information about power modes. Note that it is not allowed to go to System OFF when a READY event is pending to be generated.

All LPCOMP registers, including [ENABLE](#), are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers will be reset.

The LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate the UP, DOWN and CROSS events. In case of wakeup from System OFF, no events will be generated, only the ANADETECT signal. See the ANADETECT register ([ANADETECT](#) on page 179) for more information on how to configure the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 177 by triggering the SAMPLE task.

See [RESETREAS](#) on page 73 for more information on how to detect a wakeup from LPCOMP.

### 6.11.1 Shared resources

The LPCOMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the LPCOMP, selecting the same analog input pin for both modules is not supported.

Additionally, LPCOMP shares registers and other resources with other peripherals that have the same ID as the LPCOMP. See [Peripherals with shared ID](#) on page 97 for more information.

The LPCOMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 6.11.2 Pin configuration

You can use the LPCOMP.PSEL register to select one of the analog input pins, **AIN0** through **AIN7**, as the analog input pin for the LPCOMP.

See [GPIO — General purpose input/output](#) on page 138 for more information about the pins. Similarly, you can use [EXTRESEL](#) on page 179 to select one of the analog reference input pins, **AIN0** and **AIN1**,

as input for AREF in case AREF is selected in [EXTREFSEL](#) on page 179. The selected analog pins will be acquired by the LPCOMP when it is enabled through [ENABLE](#) on page 178.

### 6.11.3 Registers

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x40013000   | LPCOMP     | LPCOMP   | Low power comparator |               |

Table 50: Instances

| Register     | Offset | Description                              |
|--------------|--------|--|

## 6.11.4 Electrical specification

### 6.11.4.1 LPCOMP Electrical Specification

| Symbol          | Description  | Min. | Typ. | Max. | Units   |
|-----------------|--|------|------|------|---------|
| $t_{LPCANADET}$ | Time from VIN crossing ( $\geq 50$ mV above threshold) to ANADETECT signal generated |      | 5    |      | $\mu$ s |
| $V_{INOFFSET}$  | Input offset including reference ladder error  | -40  |      | 40   | mV      |
| $V_{HYST}$      | Optional hysteresis  |      | 35   |      | mV      |
| $t_{STARTUP}$   | Startup time for LPCOMP  |      | 140  |      | $\mu$ s |

## 6.12 MWU — Memory watch unit

The Memory watch unit (MWU) can be used to generate events when a memory region is accessed by the CPU. The MWU can be configured to trigger events for access to Data RAM and Peripheral memory segments. The MWU allows an application developer to generate memory access events during development for debugging or during production execution for failure detection and recovery.

Listed here are the main features for MWU:

- Six memory regions, four user-configurable and two fixed regions in peripheral address space
- Flexible configuration of regions with START and END addresses
- Generate events on CPU read and/or write to a defined region of Data RAM or peripheral memory address space
- Programmable maskable or non-maskable (NMI) interrupt on events
- Peripheral interfaces can be watched for read and write access using subregions of the two fixed memory regions

| Memory region | START address | END address  |
|---------------|---------------|--------------|
| REGION[0..3]  | Configurable  | Configurable |
| PREGION[0]    | 0x40000000    | 0x4001FFFF   |
| PREGION[1]    | 0x40020000    | 0x4003FFFF   |

Table 52: Memory regions

Each MWU region is defined by a start address and an end address, configured by the START and END registers respectively. These addresses are byte aligned and inclusive. The END register value has to be greater or equal to the START register value. Each region is associated with a pair of events that indicate that either a write access or a read access from the CPU has been detected inside the region.

For regions containing subregions (see below), a set of status registers PERREGION[0..1].SUBSTATWA and PERREGION[0..1].SUBSTATRA indicate which subregion(s) caused the EVENT\_PREGION[0..1].WA and EVENT\_PREGION[0..1].RA respectively.

The MWU is only able to detect memory accesses in the Data RAM and Peripheral memory segments from the CPU, see [Memory](#) on page 19 for more information about the different memory segments. EasyDMA

accesses are not monitored by the MWU. The MWU requires two HCLK cycles to detect and generate the event.

The peripheral regions, PREGION[0..1], are divided into 32 equally sized subregions, SR[0..31]. All subregions are excluded in the main region by default, and any can be included by specifying them in the SUBS register. When a subregion is excluded from the main region, the memory watch mechanism will not trigger any events when that subregion is accessed.

Subregions in PREGION[0..1] cannot be individually configured for read or write access watch. Watch configuration is only possible for a region as a whole. The PRGNiRA and PRGNiWA (i=0..1) fields in the REGIONEN register control watching read and write access.

REGION[0..3] can be individually enabled for read and/or write access watching through their respective RGNiRA and RGNiWA (i=0..3) fields in the REGIONEN register.

REGIONENSET and REGIONENCLR allow respectively enabling and disabling one or multiple REGIONS or PREGIONS watching in a single write access.

### 6.12.1 Registers

| Base address | Peripheral | Instance | Description       | Configuration |
|--------------|------------|----------|-------------------|---------------|
| 0x40020000   | MWU        | MWU      | Memory watch unit |               |

Table 53: Instances

| Register               | Offset | Description   |
|------------------------|--------|---|
| EVENTS_REGION[0].WA    | 0x100  | Write access to region 0 detected   |
| EVENTS_REGION[0].RA    | 0x104  | Read access to region 0 detected  |
| EVENTS_REGION[1].WA    | 0x108  | Write access to region 1 detected   |
| EVENTS_REGION[1].RA    | 0x10C  | Read access to region 1 detected  |
| EVENTS_REGION[2].WA    | 0x110  | Write access to region 2 detected   |
| EVENTS_REGION[2].RA    | 0x114  | Read access to region 2 detected  |
| EVENTS_REGION[3].WA    | 0x118  | Write access to region 3 detected   |
| EVENTS_REGION[3].RA    | 0x11C  | Read access to region 3 detected  |
| EVENTS_PREGION[0].WA   | 0x160  | Write access to peripheral region 0 detected  |
| EVENTS_PREGION[0].RA   | 0x164  | Read access to peripheral region 0 detected   |
| EVENTS_PREGION[1].WA   | 0x168  | Write access to peripheral region 1 detected  |
| EVENTS_PREGION[1].RA   | 0x16C  | Read access to peripheral region 1 detected   |
| INTEN                  | 0x300  | Enable or disable interrupt   |
| INTENSET               | 0x304  | Enable interrupt  |
| INTENCLR               | 0x308  | Disable interrupt   |
| NMIEN                  | 0x320  | Enable or disable interrupt   |
| NMIENSET               | 0x324  | Enable interrupt  |
| NMIENCLR               | 0x328  | Disable interrupt   |
| PERREGION[0].SUBSTATWA | 0x400  | Source of event/interrupt in region 0, write access detected while corresponding subregion was enabled for watching |
| PERREGION[0].SUBSTATRA | 0x404  | Source of event/interrupt in region 0, read access detected while corresponding subregion was enabled for watching  |
| PERREGION[1].SUBSTATWA | 0x408  | Source of event/interrupt in region 1, write access detected while corresponding subregion was enabled for watching |
| PERREGION[1].SUBSTATRA | 0x40C  | Source of event/interrupt in region 1, read access detected while corresponding subregion was enabled for watching  |
| REGIONEN               | 0x510  | Enable/disable regions watch  |
| REGIONENSET            | 0x514  | Enable regions watch  |
| REGIONENCLR            | 0x518  | Disable regions watch   |

| Register         | Offset | Description                |
|------------------|--------|----------------------------|
| REGION[0].START  | 0x600  | Start address for region 0 |
| REGION[0].END    | 0x604  | End address of region 0    |
| REGION[1].START  | 0x610  | Start address for region 1 |
| REGION[1].END    | 0x614  | End address of region 1    |
| REGION[2].START  | 0x620  | Start address for region 2 |
| REGION[2].END    | 0x624  | End address of region 2    |
| REGION[3].START  | 0x630  | Start address for region 3 |
| REGION[3].END    | 0x634  | End address of region 3    |
| PREGION[0].START | 0x6C0  | Reserved for future use    |
| PREGION[0].END   | 0x6C4  | Reserved for future use    |
| PREGION[0].SUBS  | 0x6C8  | Subregions of region 0     |
| PREGION[1].START | 0x6D0  | Reserved for future use    |
| PREGION[1].END   | 0x6D4  | Reserved for future use    |
| PREGION[1].SUBS  | 0x6D8  | Subregions of region 1     |

Table 54: Register overview

## 6.13 NFCT — Near field communication tag

The NFCT peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

With appropriate software, the NFCT peripheral can be used as the listening device NFC-A as specified by the [NFC Forum](#).

Listed here are the main features for the NFCT peripheral:

- NFC-A listen mode operation
  - 13.56 MHz input frequency
  - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, cyclic redundancy check (CRC), and parity functions

Figure 58: NFCT block diagram

### 6.13.1 Overview

The NFCT peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator with 106 kbps data rate as defined by the NFC Forum.

Figure 59: NFCT overview

When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent. The received frames will be automatically disassembled and the data part of the frame transferred to RAM.

The NFCT peripheral also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFCT functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a **FIELDDETECTED** event. When the strength of the field no longer supports NFC communication, the module will generate a **FIELDLOST** event. For the Low Power Field Detect threshold values, refer to [NFCT Electrical Specification](#) on page 224.

In System OFF, the NFCT Low Power Field Detect function can wake the system up through a reset. See [RESETREAS](#) on page 73 for more information on how to detect a wakeup from NFCT.

If the system is put into System OFF mode while a field is already present, the NFCT Low Power Field Detect function will wake the system up right away and generate a reset.

**Important:** As a consequence of a reset, NFCT is disabled, and therefore the reset handler will have to activate NFCT again and set it up properly.

The HFXO must be running before the NFCT peripheral goes into ACTIVATED state. Note that the NFCT peripheral calibration is automatically done on **ACTIVATE** task. The HFXO can be turned off when the NFCT peripheral goes into SENSE mode. The shortcut **FIELDDETECTED\_ACTIVATE** can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the [TXD.FRAMECONFIG](#) on page 219 register. Incoming data will be disassembled according to the [RXD.FRAMECONFIG](#) register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFCT peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

### 6.13.2 Operating states

Tasks and events are used to control the operating state of the peripheral. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [NFCT block diagram](#) on page 195 and [NFCT state diagram, automatic collision resolution enabled](#) on page 197 for more information. See *NFC Forum, NFC Activity Technical Specification* for description on NFCT operating states.

Figure 60: NFCT state diagram, automatic collision resolution enabled

Figure 61: NFCT state diagram, automatic collision resolution disabled

**Important:**

- FIELDLOST event is not generated in SENSE mode.
- Sending SENSE task while field is still present does not generate **FIELDDETECTED** event.
- If the FIELDDETECTED event is cleared before sending the **ACTIVATE** task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED\_ACTIVATE can be used to avoid this condition.

### 6.13.3 Pin configuration

NFCT uses two pins to connect the antenna and these pins are shared with GPIOs.

The PROTECT field in the NFCPINS register in UICR defines the usage of these pins and their protection level against excessive voltages. The content of the NFCPINS register is reloaded at every reset. See [Pin assignments](#) on page 557 for the pins used by the NFCT peripheral.

When NFCPINS.PROTECT=NFC, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if voltage difference exceeds approximately 2V. The GPIO function on those pins will also be disabled.

When NFCPINS.PROTECT=Disabled, the device will not be protected against strong NFC field damages caught by a connected NFCT antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFCT antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those (refer to  $C_{PAD\_NFC}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 138), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power, the two pins should always be set to the same logical value whenever entering one of the device power saving modes. For details, refer to  $I_{NFC\_LEAK}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 138.

### 6.13.4 EasyDMA

The NFCT peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM.

The NFCT EasyDMA utilizes a pointer called [PACKETPTR](#) on page 219 for receiving and transmitting packets.

The NFCT peripheral uses EasyDMA to read or write RAM, but not both at the same time. The event [RXFRAMESTART](#) indicates that the EasyDMA has started writing to the RAM for a receive frame and the event [RXFRAMEEND](#) indicates that the EasyDMA has completed writing to the RAM. Similarly, the event [TXFRAMESTART](#) indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event [TXFRAMEEND](#) indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA is writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation when there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the TXFRAMEEND or RXFRAMEEND event for the ongoing transmit or receive before starting a new receive or transmit operation.

The [MAXLEN](#) on page 219 register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to ensure that the NFCT peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the [RXD.AMOUNT](#) or [TXD.AMOUNT](#) register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer

will be incomplete. In that situation, in RX, the **OVERRUN** bit in the **FRAMESTATUS.RX** register will be set and an **RXERROR** event will be triggered.

**Important:** The **RXD.AMOUNT** and **TXD.AMOUNT** define a frame length in bytes and bits excluding start of frame (SoF), end of frame (EoF), and parity, but including CRC for **RXD.AMOUNT** only. Make sure to take potential additional bits into account when setting **MAXLEN**.

Only sending task **ENABLERXDATA** ensures that a new value in **PACKETPTR** pointing to the RX buffer in Data RAM is taken into account.

If **PACKETPTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a hard fault or RAM corruption. For more information about the different memory regions, see Chapter **Memory** on page 19.

The NFCT peripherals normally do alternative receive and transmit frames. Therefore, to prepare for the next frame, the **PACKETPTR**, **MAXLEN**, **TXD.FRAMECONFIG** and **TXD.AMOUNT** can be updated while the receive is in progress, and, similarly, the **PACKETPTR**, **MAXLEN** and **RXD.FRAMECONFIG** can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the **STARTED** event of the current frame has been received. Updating the **TXD.FRAMECONFIG** and **TXD.AMOUNT** during the current transmit frame or updating **RXD.FRAMECONFIG** during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least significant bit (LSB) from the least significant byte (LSByte) is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

### 6.13.5 Frame assembler

The NFCT peripheral implements a frame assembler in hardware.

When the NFCT peripheral is in the **ACTIVE\_A** state, the software can decide to enter RX or TX mode. For RX, see **Frame disassembler** on page 200. For TX, the software must indicate the address of the source buffer in Data RAM and its size through programming the **PACKETPTR** and **MAXLEN** registers respectively, then issuing a **STARTTX** task.

**MAXLEN** must be set so that it matches the size of the frame to be sent.

The **STARTED** event indicates that the **PACKETPTR** and **MAXLEN** registers have been captured by the frame assembler EasyDMA.

When asserting the **STARTTX** task, the frame assembler module will start reading **TXD.AMOUNT.TXDATABYTES** bytes (plus one additional byte if **TXD.AMOUNT.TXDATABITS > 0**) from the RAM position set by the **PACKETPTR**.

The NFCT peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly if set in **TXD.FRAMECONFIG**. The NFCT peripheral will take  $(8 * \text{TXD.AMOUNT.TXDATABYTES} + \text{TXD.AMOUNT.TXDATABITS})$  bits and assemble a frame according to the settings in **TXD.FRAMECONFIG**. Both short frames, standard frames, and bit-oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by the correct setting of the **TXD.FRAMECONFIG** register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte, least significant bit (LSB) first. That is, b0 will be transmitted on air before b1, and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Important:** Some NFC Forum documents, such as *NFC Forum, NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (most significant bit (MSB)), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally number them from b0 to b7. The present document uses the b0–b7 numbering scheme. Be aware of this when comparing the *NFC Forum, NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add SoF symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES. TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY = Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The frame assemble operation is illustrated in [Frame assemble illustration](#) on page 200 for different settings in TXD.FRAMECONFIG. All shaded bit fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Note that the frames illustrated do not necessarily comply with the NFC specification. The figure is only to illustrate the behavior of the NFCT peripheral.

Figure 62: Frame assemble illustration

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

### 6.13.6 Frame disassembler

The NFCT peripheral implements a frame disassembler in hardware.

When the NFCT peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For TX, see [Frame assembler](#) on page 199. For RX, the software must indicate the address and size of the destination buffer in Data RAM through programming the `PACKETPTR` and `MAXLEN` registers before issuing an `ENABLERXDATA` task.

The `STARTED` event indicates that the `PACKETPTR` and `MAXLEN` registers have been captured by the frame disassembler EasyDMA.

When an incoming frame starts, the `RXFRAMESTART` event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove any parity bits, start of frame (SoF) and

end of frame (EoF) symbols on the fly based on `RXD.FRAMECONFIG` register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is enabled through `RXD.FRAMECONFIG`.

When an EoF symbol is detected, the NFCT peripheral will assert the `RXFRAMEEND` event and write the `RXD.AMOUNT` register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity, and CRC checking, as described above. The frame disassemble operation is illustrated below.

#### Frame on air

PARITY = Parity  
RXDATABITS = 0  
CRCMODERX = CRC16RX

PARITY = Parity  
CRCMODERX = NoCRCTR  
RXDATABITS = 4

PARITY = NoParity  
CRCMODERX = NoCRCRX  
RXDATABITS = 0

#### Data to RAM

Figure 63: Frame disassemble illustration

Per NFC specification, the time between EoF to the next SoF can be as short as 86  $\mu$ s, and therefore care must be taken that `PACKETPTR` and `MAXLEN` are ready and `ENABLERXDATA` is issued on time after the end of previous frame. The use of a PPI shortcut from `TXFRAMEEND` to `ENABLERXDATA` is recommended.

### 6.13.7 Frame timing controller

The NFCT peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF carrier clock periods since the end of the EoF of the last received frame.

The NFCT peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of `FRAMEDELAYMODE` = Window, a `STARTTX` task triggered before the frame timing controller counter is equal to `FRAMEDELAYMIN` will force the transmission to halt until the counter is equal to `FRAMEDELAYMIN`. If the counter is within `FRAMEDELAYMIN` and `FRAMEDELAYMAX` when the `STARTTX` task is triggered, the NFCT peripheral will start the transmission straight away. In case of `FRAMEDELAYMODE` = ExactVal, a `STARTTX` task triggered before the frame delay counter is equal to `FRAMEDELAYMAX` will halt the actual transmission start until the counter is equal to `FRAMEDELAYMAX`.

In case of `FRAMEDELAYMODE` = WindowGrid, the behaviour is similar to the `FRAMEDELAYMODE` = Window, but the actual transmission between `FRAMEDELAYMIN` and `FRAMEDELAYMAX` starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

An `ERROR` event (with `FRAMEDELAYTIMEOUT` cause in `ERRORSTATUS`) will be asserted if the frame timing controller counter reaches `FRAMEDELAYMAX` without any `STARTTX` task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being generated may also result in an `ERROR` event (with `FRAMEDELAYTIMEOUT` cause in `ERRORSTATUS`). The `FRAMEDELAYMIN` and `FRAMEDELAYMAX` values shall only be updated before the `STARTTX` task is triggered. Failing to do so may cause unpredictable behaviour.

The frame timing controller operation is illustrated in [Frame timing controller \(FRAMEDELAYMODE=Window\)](#) on page 202. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Figure 64: Frame timing controller (FRAMEDELAYMODE=Window)

### 6.13.8 Collision resolution

The NFCT peripheral implements an automatic collision resolution function as defined by the NFC Forum.

Automatic collision resolution is enabled by default, and it is recommended that the feature is used since it is power efficient and reduces the complexity of software handling the collision resolution sequence. This feature can be disabled through the MODE field in the [AUTOCOLRESCONFIG](#) register. When the automatic collision resolution is disabled, all commands will be sent over EasyDMA as defined in frame disassembler.

The [SENSRES](#) and [SELRES](#) registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1\_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in FICR and can be used by software to populate the NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST registers.

[NFCID1 byte allocation \(top sent first on air\)](#) on page 203 explains the position of the ID bytes in NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

|          | ID = 4 bytes        | ID = 7 bytes        | ID = 10 bytes       |
|----------|---------------------|---------------------|---------------------|
| NFCID1_Q |                     |                     | nfcid1 <sub>0</sub> |
| NFCID1_R |                     |                     | nfcid1 <sub>1</sub> |
| NFCID1_S |                     |                     | nfcid1 <sub>2</sub> |
| NFCID1_T |                     | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> |
| NFCID1_U |                     | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> |
| NFCID1_V |                     | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> |
| NFCID1_W | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> |
| NFCID1_X | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> | nfcid1 <sub>7</sub> |
| NFCID1_Y | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> | nfcid1 <sub>8</sub> |
| NFCID1_Z | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> | nfcid1 <sub>9</sub> |

Table 55: NFCID1 byte allocation (top sent first on air)

The hardware implementation can handle the states from IDLE to ACTIVE\_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an **AUTOCOLRESSTARTED** event when it has started. Reaching the ACTIVE\_A state is indicated by the **SELECTED** event.

If collision resolution fails, a **COLLISION** event is triggered. Note that errors occurring during automatic collision resolution may also cause **ERROR** and/or **RXERROR** events to be generated. Other events may also get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut is disabled during automatic collision resolution.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE\_A state. The automatic collision resolution feature can be disabled while in ACTIVE\_A state to avoid this.

The SLP\_REQ is automatically handled by the NFCT peripheral when the automatic collision resolution is enabled. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP\_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

### 6.13.9 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the  $V_{swing}$  limit.

Refer to [NFCT Electrical Specification](#) on page 224.

### 6.13.10 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between **NFC1** and **NFC2** pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

Figure 65: NFCT antenna recommendations

The required tuning capacitor value is given by the below equations:

$$C'_{tune} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} \quad \text{where } C'_{tune} = \frac{1}{2} \cdot (C_p + C_{int} + C_{tune})$$

$$\text{and } C_{tune1} = C_{tune2} = C_{tune} \quad C_{p1} = C_{p2} = C_p \quad C_{int1} = C_{int2} = C_{int}$$

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_p - C_{int}$$

An antenna inductance of  $L_{ant} = 2 \mu\text{H}$  will give tuning capacitors in the range of 130 pF on each pin. The total capacitance on **NFC1** and **NFC2** must be matched.

### 6.13.11 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

### 6.13.12 Digital Modulation Signal

Support for external analog frontends or antenna architectures is possible by optionally outputting the digital modulation signal to a GPIO.

The NFCT peripheral is designed to connect directly to a loop antenna, receive a modulated signal from an NFC Reader with its internal analog frontend and transmit data back by changing the input resistance that is then seen as modulated load by the NFC Reader.

In addition, the peripheral has an option to output the digital modulation signal to a GPIO. Reception still occurs through the internal analog frontend, whereas transmission can be done by one of the following:

- The internal analog frontend through the loop antenna (default)
- An external frontend using the digital modulation signal
- The combination of both above

There are two registers that allow configuration of the modulation signal (i.e. of the response from NFCT to the NFC Reader), [MODULATIONCTRL](#) and [MODULATIONPSEL](#). The registers need to be programmed before NFCT sends a response to a request from a reader. Ideally, this configuration is performed during startup and whenever the NFCT peripheral is powered up.

The selected GPIO needs to be configured as output in the corresponding GPIO configuration register. It is recommended to set an output value in the corresponding GPIO.OUT register – this value will be driven whenever the NFCT peripheral is disabled.

NFCT drives the pin low when there is no modulation, and drives it with On-Off Keying (OOK) modulation of an 847 kHz subcarrier (derived from the carrier frequency) when it responds to commands from an NFC Reader.

### 6.13.14 Registers

| Base address | Peripheral | Instance | Description                  | Configuration |
|--------------|------------|----------|------------------------------|---------------|
| 0x40005000   | NFCT       | NFCT     | Near field communication tag |               |

Table 56: Instances

| Register                                 | Offset | Description  |
|--|--------|--|
| <a href="#">TASKS_ACTIVATE</a>           | 0x000  | Activate NFCT peripheral for incoming and outgoing frames, change state to activated                               |
| <a href="#">TASKS_DISABLE</a>            | 0x004  | Disable NFCT peripheral  |
| <a href="#">TASKS_SENSE</a>              | 0x008  | Enable NFC sense field mode, change state to sense mode  |
| <a href="#">TASKS_STARTTX</a>            | 0x00C  | Start transmission of an outgoing frame, change state to transmit  |
| <a href="#">TASKS_ENABLERXDATA</a>       | 0x01C  | Initializes the EasyDMA for receive.   |
| <a href="#">TASKS_GOIDLE</a>             | 0x024  | Force state machine to IDLE state  |
| <a href="#">TASKS_GOSLEEP</a>            | 0x028  | Force state machine to SLEEP_A state   |
| <a href="#">EVENTS_READY</a>             | 0x100  | The NFCT peripheral is ready to receive and send frames  |
| <a href="#">EVENTS_FIELDDETECTED</a>     | 0x104  | Remote NFC field detected  |
| <a href="#">EVENTS_FIELDLIST</a>         | 0x108  | Remote NFC field lost  |
| <a href="#">EVENTS_TXFRAMESTART</a>      | 0x10C  | Marks the start of the first symbol of a transmitted frame   |
| <a href="#">EVENTS_TXFRAMEEND</a>        | 0x110  | Marks the end of the last transmitted on-air symbol of a frame   |
| <a href="#">EVENTS_RXFRAMESTART</a>      | 0x114  | Marks the end of the first symbol of a received frame  |
| <a href="#">EVENTS_RXFRAMEEND</a>        | 0x118  | Received data has been checked (CRC, parity) and transferred to RAM, and EasyDMA has ended accessing the RX buffer |
| <a href="#">EVENTS_ERROR</a>             | 0x11C  | NFC error reported. The ERRORSTATUS register contains details on the source of the error.                          |
| <a href="#">EVENTS_RXERROR</a>           | 0x128  | NFC RX frame error reported. The FRAMESTATUS.RX register contains details on the source of the error.              |
| <a href="#">EVENTS_ENDRX</a>             | 0x12C  | RX buffer (as defined by PACKETPTR and MAXLEN) in Data RAM full.   |
| <a href="#">EVENTS_ENDTX</a>             | 0x130  | Transmission of data in RAM has ended, and EasyDMA has ended accessing the TX buffer                               |
| <a href="#">EVENTS_AUTOCOLRESSTARTED</a> | 0x138  | Auto collision resolution process has started  |
| <a href="#">EVENTS_COLLISION</a>         | 0x148  | NFC auto collision resolution error reported.  |
| <a href="#">EVENTS_SELECTED</a>          | 0x14C  | NFC auto collision resolution successfully completed   |
| <a href="#">EVENTS_STARTED</a>           | 0x150  | EasyDMA is ready to receive or send frames.  |
| <a href="#">SHORTS</a>                   | 0x200  | Shortcuts between local events and tasks   |
| <a href="#">INTEN</a>                    | 0x300  | Enable or disable interrupt  |

| Register         | Offset | Description   |
|------------------|--------|---|
| INTENSET         | 0x304  | Enable interrupt  |
| INTENCLR         | 0x308  | Disable interrupt   |
| ERRORSTATUS      | 0x404  | NFC Error Status register   |
| FRAMESTATUS.RX   | 0x40C  | Result of last incoming frame   |
| NFCTAGSTATE      | 0x410  | NfcTag state register   |
| SLEEPSTATE       | 0x420  | Sleep state during automatic collision resolution   |
| FIELDPRESENT     | 0x43C  | Indicates the presence or not of a valid field  |
| FRAMEDELAYMIN    | 0x504  | Minimum frame delay   |
| FRAMEDELAYMAX    | 0x508  | Maximum frame delay   |
| FRAMEDELAYMODE   | 0x50C  | Configuration register for the Frame Delay Timer  |
| PACKETPTR        | 0x510  | Packet pointer for TXD and RXD data storage in Data RAM   |
| MAXLEN           | 0x514  | Size of the RAM buffer allocated to TXD and RXD data storage each   |
| TXD.FRAMECONFIG  | 0x518  | Configuration of outgoing frames  |
| TXD.AMOUNT       | 0x51C  | Size of outgoing frame  |
| RXD.FRAMECONFIG  | 0x520  | Configuration of incoming frames  |
| RXD.AMOUNT       | 0x524  | Size of last incoming frame   |
| MODULATIONCTRL   | 0x52C  | Enables the modulation output to a GPIO pin which can be connected to a second external antenna.                    |
| MODULATIONPSEL   | 0x538  | Pin select for Modulation control.  |
| NFCID1_LAST      | 0x590  | Last NFCID1 part (4, 7 or 10 bytes ID)  |
| NFCID1_2ND_LAST  | 0x594  | Second last NFCID1 part (7 or 10 bytes ID)  |
| NFCID1_3RD_LAST  | 0x598  | Third last NFCID1 part (10 bytes ID)  |
| AUTOCOLRESCONFIG | 0x59C  | Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated. |
| SENSRES          | 0x5A0  | NFC-A SENS_RES auto-response settings   |
| SELRES           | 0x5A4  | NFC-A SEL_RES auto-response settings  |

Table 57: Register overview

### 6.13.14.1 TASKS\_ACTIVATE

Address offset: 0x000

Activate NFCT peripheral for incoming and outgoing frames, change state to activated

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |                |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 6.13.14.46 AUTOCOLRESCONFIG

Address offset: 0x59C

Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated.

When modifying this register bit 1 must be written to '1'.

## 6.13.15 Electrical specification

### 6.13.15.1 NFCT Electrical Specification

| Symbol      | Description   | Min. | Typ.  | Max. | Units |
|-------------|---|------|-------|------|-------|
| $f_c$       | Frequency of operation  |      | 13.56 |      | MHz   |
| $C_{MI}$    | Carrier modulation index  | 95   |       |      | %     |
| DR          | Data Rate   |      | 106   |      | kbps  |
| $V_{sense}$ | Peak differential Field detect threshold level on NFC1-NFC2 <sup>15</sup> |      | 1.2   |      | Vp    |
| $I_{max}$   | Maximum input current on NFCT pins  |      |       | 80   | mA    |

### 6.13.15.2 NFCT Timing Parameters

| Symbol         | Description   | Min. | Typ. | Max. | Units   |
|----------------|---|------|------|------|---------|
| $t_{activate}$ | Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state <sup>16</sup> |      |      | 500  | $\mu$ s |
| $t_{sense}$    | Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted          |      |      | 20   | $\mu$ s |

Figure 66: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

## 6.14 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock

<sup>15</sup> Input is high impedance in sense mode

<sup>16</sup> Does not account for voltage supply and oscillator startup times

and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters
- Selectable ratio of 64 or 80 between PDM\_CLK and output sample rate

The PDM module illustrated below is interfacing up to two digital microphones with the PDM interface. EasyDMA is implemented to relieve the real-time requirements associated with controlling of the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce pulse code modulation (PCM) samples. The PDM module allows continuous audio streaming.

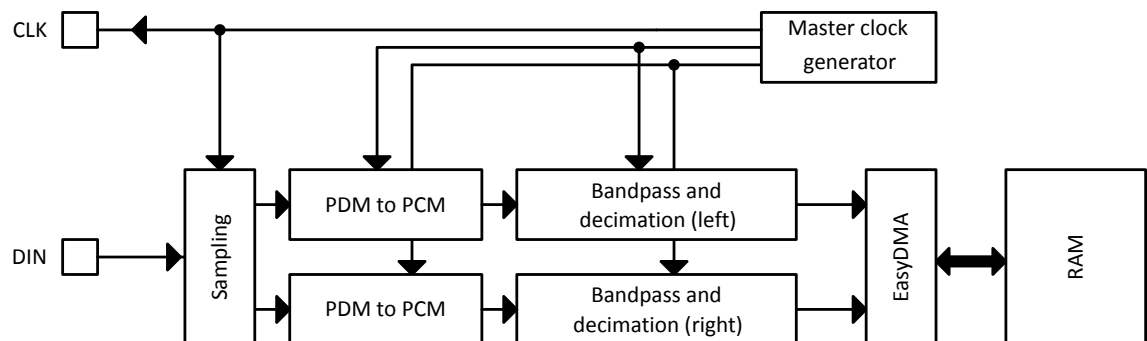

Figure 67: PDM module

### 6.14.1 Master clock generator

The master clock generator's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

### 6.14.2 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, and bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

### 6.14.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Depending on the **RATIO** selected, its output is  $2 \times 16$ -bit PCM samples at a sample rate either 64 times or 80 times (depending on the **RATIO** register) lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{\text{PDM,default}}$ . The gain is controlled by the **GAINL** and **GAINR** registers.

As an example, if the goal is to achieve 2500 RMS output samples (16-bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, do the following:

- Sum the PDM module's default gain ( $G_{\text{PDM,default}}$ ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain)
- Adjust **GAINL** and **GAINR** by the above summed amount. Assuming that only the PDM module influences the gain, **GAINL** and **GAINR** must be set to  $-G_{\text{PDM,default}}$  dB to achieve the requirement.

With  $G_{\text{PDM,default}}=3.2$  dB, and as **GAINL** and **GAINR** are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

$$\text{GAINL} = \text{GAINR} = (\text{DefaultGain} - (2 * 3))$$

Remember to check that the resulting values programmed into **GAINL** and **GAINR** fall within **MinGain** and **MaxGain**.

### 6.14.4 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in **SAMPLE.PTR** register. If the destination address set in **SAMPLE.PTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a **HardFault** or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

DMA supports Stereo (Left+Right 16-bit samples) and Mono (Left only) data transfer, depending on the setting in the **OPERATION** field in the **MODE** register. The samples are stored little endian.

| <b>MODE.OPERATION</b> | <b>Bits per sample</b> | <b>Result stored per RAM word</b> | <b>Physical RAM allocated (32-bit words)</b> | <b>Result boundary indexes in RAM</b> | <b>Note</b> |
|-----------------------|------------------------|-----------------------------------|--|---------------------------------------|-------------|
| Stereo                | 32 (2x16)              | L+R                               | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$        | $\text{R0}=[31:16]; \text{L0}=[15:0]$ | Default     |
| Mono                  | 16                     | 2xL                               | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$        | $\text{L1}=[31:16]; \text{L0}=[15:0]$ |             |

Table 58: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in **SAMPLE.MAXCNT** register. Format is number of 16-bit samples. The physical RAM allocated is always:

$$(\text{RAM allocation, in bytes}) = \text{SAMPLE.MAXCNT} * 2;$$

(but the mapping of the samples depends on **MODE.OPERATION**.)

If **OPERATION**=Stereo, RAM will contain a succession of left and right samples.

If **OPERATION**=Mono, RAM will contain a succession of left only samples.

For a given value of `SAMPLE.MAXCNT`, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the `START` task, after the `SAMPLE.PTR` and `SAMPLE.MAXCNT` registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the `STARTED` event is received, the firmware can write the next `SAMPLE.PTR` value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an `END` event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by `SAMPLE.PTR`, and sends a new `STARTED` event, so that the firmware can update `SAMPLE.PTR` to the next buffer address.

### 6.14.5 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to `CLK`, and data to `DIN`.

Figure 68: Example of a single PDM microphone, wired as left

Figure 69: Example of a single PDM microphone, wired as right

Note that in a single-microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

Figure 70: Example of two PDM microphones

## 6.14.6 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power supply](#) on page 58 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 228 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

Table 59: GPIO configuration before enabling peripheral

## 6.14.7 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---|---------------|
| 0x4001D000   | PDM        | PDM      | Pulse Density modulation (digital microphone) interface |               |

## 6.14.8 Electrical specification

### 6.14.8.1 PDM Electrical Specification

| Symbol                   | Description  | Min. | Typ.  | Max. | Units |
|--------------------------|--|------|-------|------|-------|
| $f_{\text{PDM,CLK,64}}$  | PDM clock speed. PDMCLKCTRL = Default (Setting needed for 16 MHz sample frequency @ RATIO = Ratio64) |      | 1.032 |      | MHz   |
| $f_{\text{PDM,CLK,80}}$  | PDM clock speed. PDMCLKCTRL = 1280K (Setting needed for 16 MHz sample frequency @ RATIO = Ratio80)   |      | 1.280 |      | MHz   |
| $t_{\text{PDM,JITTER}}$  | Jitter in PDM clock output   |      |       | 20   | ns    |
| $T_{\text{dPDM,CLK}}$    | PDM clock duty cycle   | 40   | 50    | 60   | %     |
| $t_{\text{PDM,DATA}}$    | Decimation filter delay  |      |       | 5    | ms    |
| $t_{\text{PDM,cv}}$      | Allowed clock edge to data valid   |      |       | 125  | ns    |
| $t_{\text{PDM,ci}}$      | Allowed (other) clock edge to data invalid   | 0    |       |      | ns    |
| $t_{\text{PDM,s}}$       | Data setup time at $f_{\text{PDM,CLK}}=1.024$ MHz or 1.280 MHz                                       | 65   |       |      | ns    |
| $t_{\text{PDM,h}}$       | Data hold time at $f_{\text{PDM,CLK}}=1.024$ MHz or 1.280 MHz  | 0    |       |      | ns    |
| $G_{\text{PDM,default}}$ | Default (reset) absolute gain of the PDM module  |      | 3.2   |      | dB    |

Figure 71: PDM timing diagram

## 6.15 PPI — Programmable peripheral interconnect

The programmable peripheral interconnect (PPI) enables peripherals to interact autonomously with each other using tasks and events independent of the CPU. The PPI allows precise synchronization between peripherals when real-time application constraints exist and eliminates the need for CPU activity to implement behavior which can be predefined using PPI.

Figure 72: PPI block diagram

The PPI system has, in addition to the fully programmable peripheral interconnections, a set of channels where the event end point (EEP) and task end points (TEP) are fixed in hardware. These fixed channels can be individually enabled, disabled, or added to PPI channel groups (see CHG[n] registers), in the same way as ordinary PPI channels.

| Instance    | Channel | Number of channels |
|-------------|---------|--------------------|
| PPI         | 0-19    | 20                 |
| PPI (fixed) | 20-31   | 12                 |

Table 62: Configurable and fixed PPI channels

The PPI provides a mechanism to automatically trigger a task in one peripheral as a result of an event occurring in another peripheral. A task is connected to an event through a PPI channel. The PPI channel is composed of three end point registers, one EEP, and two TEPs. A peripheral task is connected to a TEP using the address of the task register associated with the task. Similarly, a peripheral event is connected to an EEP using the address of the event register associated with the event.

On each PPI channel, the signals are synchronized to the 16 MHz clock to avoid any internal violation of setup and hold timings. As a consequence, events that are synchronous to the 16 MHz clock will be delayed by one clock period, while other asynchronous events will be delayed by up to one 16 MHz clock period.

**Note:** Shortcuts (as defined in the SHORTS register in each peripheral) are not affected by this 16 MHz synchronization, and are therefore not delayed.

Each TEP implements a fork mechanism that enables a second task to be triggered at the same time as the task specified in the TEP is triggered. This second task is configured in the task end point register in the FORK registers groups, e.g. FORK.TEP[0] is associated with PPI channel CH[0].

There are two ways of enabling and disabling PPI channels:

- Enable or disable PPI channels individually using the CHEN, CHENSET, and CHENCLR registers.
- Enable or disable PPI channels in PPI channel groups through the groups' ENABLE and DISABLE tasks. Prior to these tasks being triggered, the PPI channel group must be configured to define which PPI channels belong to which groups.

**Note:** When a channel belongs to two groups m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN on that channel has priority.

PPI tasks (for example, CHG[0].EN) can be triggered through the PPI like any other task, which means they can be hooked to a PPI channel as a TEP. One event can trigger multiple tasks by using multiple channels and one task can be triggered by multiple events in the same way.

### 6.15.1 Pre-programmed channels

Some of the PPI channels are pre-programmed. These channels cannot be configured by the CPU, but can be added to groups and enabled and disabled like the general purpose PPI channels. The FORK TEP for these channels are still programmable and can be used by the application.

For a list of pre-programmed PPI channels, see the following table.

| Channel | EEP                       | TEP                      |
|---------|---------------------------|--------------------------|
| 20      | TIMERO->EVENTS_COMPARE[0] | RADIO->TASKS_TXEN        |
| 21      | TIMERO->EVENTS_COMPARE[0] | RADIO->TASKS_RXEN        |
| 22      | TIMERO->EVENTS_COMPARE[1] | RADIO->TASKS_DISABLE     |
| 23      | RADIO->EVENTS_BCMATCH     | AAR->TASKS_START         |
| 24      | RADIO->EVENTS_READY       | CCM->TASKS_KSGEN         |
| 25      | RADIO->EVENTS_ADDRESS     | CCM->TASKS_CRYPT         |
| 26      | RADIO->EVENTS_ADDRESS     | TIMERO->TASKS_CAPTURE[1] |
| 27      | RADIO->EVENTS_END         | TIMERO->TASKS_CAPTURE[2] |
| 28      | RTC0->EVENTS_COMPARE[0]   | RADIO->TASKS_TXEN        |
| 29      | RTC0->EVENTS_COMPARE[0]   | RADIO->TASKS_RXEN        |
| 30      | RTC0->EVENTS_COMPARE[0]   | TIMERO->TASKS_CLEAR      |
| 31      | RTC0->EVENTS_COMPARE[0]   | TIMERO->TASKS_START      |

Table 63: Pre-programmed channels

### 6.15.2 Registers

| Base address | Peripheral | Instance | Description                          | Configuration |
|--------------|------------|----------|--------------------------------------|---------------|
| 0x4001F000   | PPI        | PPI      | Programmable peripheral interconnect |               |

Table 64: Instances

| Register         | Offset | Description             |
|------------------|--------|-------------------------|
| TASKS_CHG[0].EN  | 0x000  | Enable channel group 0  |
| TASKS_CHG[0].DIS | 0x004  | Disable channel group 0 |
| TASKS_CHG[1].EN  | 0x008  | Enable channel group 1  |
| TASKS_CHG[1].DIS | 0x00C  | Disable channel group 1 |

| Register         | Offset | Description                   |
|------------------|--------|-------------------------------|
| TASKS_CHG[2].EN  | 0x010  | Enable channel group 2        |
| TASKS_CHG[2].DIS | 0x014  | Disable channel group 2       |

## 6.16 PWM — Pulse width modulation

The pulse with modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 73: PWM module

### 6.16.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a value read from RAM (see figure [Decoder memory access modes](#) on page 246). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM\_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 246 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM\_MODE\_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 74: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to FallingEdge. Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

$$\text{PWM period: } T_{\text{PWM(Up)}} = T_{\text{PWM\_CLK}} * \text{COUNTERTOP}$$

Step width/Resolution:  $T_{steps} = T_{PWM\_CLK}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM\_MODE\_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

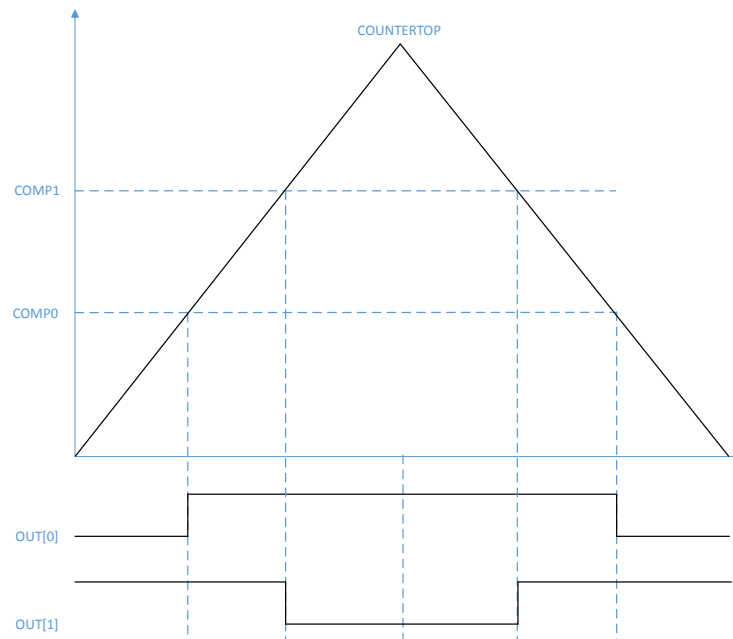

Figure 75: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{PWM(Up\ And\ Down)} = T_{PWM\_CLK} * 2 * COUNTERTOP$$

Step width/Resolution:  $T_{steps} = T_{PWM\_CLK} * 2$

### 6.16.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |          |             |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

|                  |   |          | FallingEdge | 1     | First edge within the PWM period is falling                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 76: Decoder memory access modes

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load

the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)<sup>th</sup> PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDelay are ignored when DECODER.MODE=NextStep. The next value is loaded upon every received NEXTSTEP task.

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions. After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the SEQSTART[n] task is triggered, the task will load the first value from RAM and then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of such simple playback:

Figure 77: Simple sequence example

Figure depicts the source code used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register. PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The table below indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register        | Taken into account by hardware  | Recommended (safe) update   |
|-----------------|---|---|
| SEQ[n].PTR      | When sending the SEQSTART[n] task   | After having received the SEQSTARTED[n] event   |
| SEQ[n].CNT      | When sending the SEQSTART[n] task   | After having received the SEQSTARTED[n] event   |
| SEQ[0].ENDDelay | When sending the SEQSTART[0] task<br><br>Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [0] through a SEQSTART[0] task<br><br>When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event)<br><br>At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated) |
| SEQ[1].ENDDelay | When sending the SEQSTART[1] task<br><br>Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [1] through a SEQSTART[1] task<br><br>When no more value from sequence [1] gets loaded from RAM (indicated by the SEQEND[1] event)<br><br>At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated) |
| SEQ[0].REFRESH  | When sending the SEQSTART[0] task<br><br>Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [0] through a SEQSTART[0] task<br><br>At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)   |
| SEQ[1].REFRESH  | When sending the SEQSTART[1] task<br><br>Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | Before starting sequence [1] through a SEQSTART[1] task<br><br>At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)   |
| COUNTERTOP      | In DECODER.LOAD=WaveForm: this register is ignored.<br><br>In all other LOAD modes: at the end of current PWM period (indicated by the PWMPERIODEND event)                            | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been triggered, and the STOPPED event has been received.   |
| MODE            | Immediately   | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been triggered, and the STOPPED event has been received.   |
| DECODER         | Immediately   | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been triggered, and the STOPPED event has been received.   |
| PRESCALER       | Immediately   | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been triggered, and the STOPPED event has been received.   |
| LOOP            | Immediately   | Before starting PWM generation through a SEQSTART[n] task<br><br>After a STOP task has been triggered, and the STOPPED event has been received.   |
| PSEL.OUT[n]     | Immediately   | Before enabling the PWM instance through the ENABLE register  |

Table 66: When to safely update PWM registers

**Note:** SEQ[n].REFRESH and SEQ[n].ENDDelay are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

A more complex example, where LOOP.CNT>0, is shown in the following figure:

Figure 78: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDDELAY=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDDELAY=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR  = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT  = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR  = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT  = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Figure 79: Single shot (LOOP.CNT=0)

**Note:** The single-shot example also applies to SEQ[1]. Only SEQ[0] is represented for simplicity.

Figure 80: Complex sequence (LOOP.CNT>0) starting with SEQ[0]

Figure 81: Complex sequence ( $LOOP.CNT > 0$ ) starting with  $SEQ[1]$

**Note:** If a sequence is in use in a simple or complex sequence, it must have a length of  $SEQ[n].CNT > 0$ .

### 6.16.3 Limitations

Previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

### 6.16.4 Pin configuration

The  $OUT[n]$  ( $n=0..3$ ) signals associated with each PWM channel are mapped to physical pins according to the configuration of  $PSEL.OUT[n]$  registers. If  $PSEL.OUT[n].CONNECT$  is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The  $PSEL.OUT[n]$  registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see section [POWER](#) for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin                                       | Direction | Output value | Comment                                 |
|------------|---|-----------|--------------|---|
| $OUT[n]$   | As specified in $PSEL.OUT[n]$<br>( $n=0..3$ ) | Output    | 0            | Idle state defined in GPIO OUT register |

Table 67: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

## 6.16.5 Registers

| Base address | Peripheral | Instance | Description                   | Configuration |
|--------------|------------|----------|-------------------------------|---------------|
| 0x4001C000   | PWM        | PWM0     | Pulse width modulation unit 0 |               |
| 0x40021000   | PWM        | PWM1     | Pulse width modulation unit 1 |               |
| 0x40022000   | PWM        | PWM2     | Pulse width modulation unit 2 |               |
| 0x4002D000   | PWM        | PWM3     | Pulse width modulation unit 3 |               |

Table 68: Instances

| Register             | Offset | Description  |
|----------------------|--------|--|
| TASKS_STOP           | 0x004  | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback   |
| TASKS_SEQSTART[0]    | 0x008  | Loads the first PWM value on all enabled channels from sequence 0, and starts playing that sequence at the rate defined in SEQ[0]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_SEQSTART[1]    | 0x00C  | Loads the first PWM value on all enabled channels from sequence 1, and starts playing that sequence at the rate defined in SEQ[1]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_NEXTSTEP       | 0x010  | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.  |
| EVENTS_STOPPED       | 0x104  | Response to STOP task, emitted when PWM pulses are no longer generated   |
| EVENTS_SEQSTARTED[0] | 0x108  | First PWM period started on sequence 0   |
| EVENTS_SEQSTARTED[1] | 0x10C  | First PWM period started on sequence 1   |
| EVENTS_SEQEND[0]     | 0x110  | Emitted at end of every sequence 0, when last value from RAM has been applied to wave counter  |
| EVENTS_SEQEND[1]     | 0x114  | Emitted at end of every sequence 1, when last value from RAM has been applied to wave counter  |
| EVENTS_PWMPERIODEND  | 0x118  | Emitted at the end of each PWM period  |
| EVENTS_LOOPSDONE     | 0x11C  | Concatenated sequences have been played the amount of times defined in LOOP.CNT  |
| SHORTS               | 0x200  | Shortcuts between local events and tasks   |
| INTEN                | 0x300  | Enable or disable interrupt  |
| INTENSET             | 0x304  | Enable interrupt   |
| INTENCLR             | 0x308  | Disable interrupt  |
| ENABLE               | 0x500  | PWM module enable register   |
| MODE                 | 0x504  | Selects operating mode of the wave counter   |
| COUNTERTOP           | 0x508  | Value up to which the pulse generator counter counts   |
| PRESCALER            | 0x50C  | Configuration for PWM_CLK  |
| DECODER              | 0x510  | Configuration of the decoder   |
| LOOP                 | 0x514  | Number of playbacks of a loop  |
| SEQ[0].PTR           | 0x520  | Beginning address in RAM of this sequence  |
| SEQ[0].CNT           | 0x524  | Number of values (duty cycles) in this sequence  |
| SEQ[0].REFRESH       | 0x528  | Number of additional PWM periods between samples loaded into compare register  |
| SEQ[0].ENDELAY       | 0x52C  | Time added after the sequence  |
| SEQ[1].PTR           | 0x540  | Beginning address in RAM of this sequence  |

| Register         | Offset | Description   |
|------------------|--------|---|
| SEQ[1].CNT       | 0x544  | Number of values (duty cycles) in this sequence                               |
| SEQ[1].REFRESH   | 0x548  | Number of additional PWM periods between samples loaded into compare register |
| SEQ[1].ENDEDELAY | 0x54C  | Time added after the sequence   |
| PSEL.OUT[0]      | 0x560  | Output pin select for PWM channel 0   |
| PSEL.OUT[1]      | 0x564  | Output pin select for PWM channel 1   |
| PSEL.OUT[2]      | 0x568  | Output pin select for PWM channel 2   |
| PSEL.OUT[3]      | 0x56C  | Output pin select for PWM channel 3   |

Table 69: Register overview

### 6.16.5.1 TASKS\_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

| Bit number       | 31  | 30         | 29    | 28   | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
|------------------|---|------------|-------|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| ID               |   |            |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |            |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce Field  | Value ID   | Value | Description  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| A                | W   | TASKS_STOP |       | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
|                  |   | Trigger    | 1     | Trigger task   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |

### 6.16.5.2 TASKS\_SEQSTART[n] (n=0..1)

Address offset: 0x008 + (n × 0x4)

Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running.

| Bit number       | 31  | 30             | 29    | 28   | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
|------------------|---|----------------|-------|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| ID               |   |                |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |                |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce Field  | Value ID       | Value | Description  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
| A                | W   | TASKS_SEQSTART |       | Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |
|                  |   | Trigger        | 1     | Trigger task   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |

### 6.16.5.3 TASKS\_NEXTSTEP

Address offset: 0x010

Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.

| Bit number | 31         | 30             | 29    | 28  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |
|------------|------------|----------------|-------|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|

## 6.17 QDEC — Quadrature decoder

The Quadrature decoder (QDEC) provides buffered decoding of quadrature-encoded sensor signals. It is suitable for mechanical and optical sensors.

The sample period and accumulation are configurable to match application requirements. The QDEC provides the following:

- Digital waveform decoding from off-chip quadrature encoder
- Sample accumulation eliminating hard real-time requirements to be enforced on application
- Optional input de-bounce filters.
- Optional LED output signal for optical encoders

Figure 82: Quadrature decoder configuration

### 6.17.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by the waveform that changes level first. Invalid transitions may occur, meaning the two waveforms simultaneously switch. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the SAMPLEPER register.

If the SAMPLEPER value needs to be changed, the QDEC shall be stopped using the STOP task. SAMPLEPER can be then changed upon receiving the STOPPED event, and QDEC can be restarted using the START task. Failing to do so may result in unpredictable behavior.

It is good practice to only change registers LEDPOL, REPORTPER, DBFEN, and LEDPRE when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

| Previous sample pair(n-1) |   | Current samples pair(n) |   | SAMPLE register | ACC operation | ACCDBL operation | Description                    |
|---------------------------|---|-------------------------|---|-----------------|---------------|------------------|--------------------------------|
| A                         | B | A                       | B |                 |               |                  |                                |
| 0                         | 0 | 0                       | 0 | 0               | No change     | No change        | No movement                    |

| 1                         | 1 | 0                       | 1 | -1              | Decrement     | No change        | Movement in negative direction |
| 1                         | 1 | 1                       | 0 | 1               | Increment     | No change        | Movement in positive direction |
| 1                         | 1 | 1                       | 1 | 0               | No change     | No change        | No movement                    |

Table 70: Sampled value encoding

## 6.17.2 LED output

The LED output follows the sample period. The LED is switched on for a set period before sampling and then switched off immediately after. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

When using off-chip mechanical encoders not requiring an LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case, the QDEC will not acquire access to a pin for the LED output.

## 6.17.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register). The filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter. Any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. It is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

When the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

### 6.17.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL. These registers accumulate valid motion sample values and the number of detected invalid samples (double transitions), respectively.

The ACC register accumulates all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register, the application can fetch data when necessary instead of reading all SAMPLE register output. The ACC register holds the relative movement of the external mechanical device from the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event is generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples that do not cause the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automated capture of multiple samples before sending an event. When a non-null displacement is captured and accumulated, a REPORTRDY event is sent. When one or more double-displacements are captured and accumulated, a DBLRDY event is sent. The REPORTPER field in this register determines how many samples must be accumulated before the contents are evaluated and a REPORTRDY or DBLRDY event is sent.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRACC shortcut), ACCREAD can then be read.

When a double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRDBL shortcut), ACCDBLREAD can then be read.

### 6.17.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins are acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers used for the QDEC are selected using the PSEL.n registers.

### 6.17.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode.

When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 266 before enabling the QDEC. This configuration must be retained in the GPIO for the selected I/Os as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| QDEC signal | QDEC pin                 | Direction | Output value   | Comment |
|-------------|--------------------------|-----------|----------------|---------|
| Phase A     | As specified in PSEL.A   | Input     | Not applicable |         |
| Phase B     | As specified in PSEL.B   | Input     | Not applicable |         |
| LED         | As specified in PSEL.LED | Input     | Not applicable |         |

## 6.17.8 Electrical specification

### 6.17.8.1 QDEC Electrical Specification

| Symbol              | Description   | Min. | Typ. | Max.   | Units |
|---------------------|---|------|------|--------|-------|
| t <sub>SAMPLE</sub> | Time between sampling signals from quadrature decoder | 128  |      | 131072 | μs    |
| t <sub>LED</sub>    | Time from LED is turned on to signals are sampled     | 0    |      | 511    | μs    |

## 6.18 RADIO — 2.4 GHz radio

The 2.4 GHz radio transceiver is compatible with multiple radio standards such as 1 Mbps and 2 Mbps *Bluetooth*<sup>®</sup> Low Energy modes, Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes, IEEE 802.15.4 250 kbps mode, as well as Nordic's proprietary 1 Mbps and 2 Mbps modes.

Listed here are main features for the RADIO:

- Multidomain 2.4 GHz radio transceiver
  - 1 Mbps and 2 Mbps *Bluetooth*<sup>®</sup> Low Energy modes
  - Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes
  - Angle-of-arrival (AoA) and angle-of-departure (AoD) direction finding using *Bluetooth*<sup>®</sup> Low Energy
  - IEEE 802.15.4 250 kbps mode
  - 1 Mbps and 2 Mbps Nordic proprietary modes
- Best in class link budget and low power operation
- Efficient data interface with EasyDMA support
- Automatic address filtering and pattern matching

EasyDMA, in combination with an automated packet assembler, packet disassembler, automated CRC generator and CRC checker, makes it easy to configure and use the RADIO. See the following figure for details.

Figure 83: RADIO block diagram

The RADIO includes a device address match unit and an interframe spacing control unit that can be utilized to simplify address whitelisting and interframe spacing respectively in *Bluetooth*<sup>®</sup> low energy and similar applications.

The RADIO also includes a received signal strength indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits are sent or received by the RADIO.

### 6.18.1 Packet configuration

A RADIO packet contains the fields PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD, and CRC. For Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes, fields CI, TERM1 and TERM2 are also included.

The content of a RADIO packet is illustrated in the figures below. The RADIO sends the fields in the packet according to the order illustrated in the figures, starting on the left.

Figure 84: On-air packet layout

Figure 85: On-air packet layout for Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes

Not shown in the figures is the static payload add-on (the length of which is defined in `PCNF1.STATLEN`, and which is 0 bytes in a standard BLE packet). The static payload add-on is sent between PAYLOAD and CRC fields. The RADIO sends the different fields in the packet in the order they are illustrated above, from left to right.

PREAMBLE is sent with least significant bit first on air. The size of the PREAMBLE depends on the mode selected in the `MODE` register:

- The PREAMBLE is one byte for `MODE = Ble_1Mbit` as well as all Nordic proprietary operating modes (`MODE = Nrf_1Mbit` and `MODE = Nrf_2Mbit`), and `PCNF0.PLEN` has to be set accordingly. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAA. Otherwise the PREAMBLE will be set to 0x55.

- For **MODE** = Ble\_2Mbit, the PREAMBLE must be set to 2 byte through **PCNF0.PLEN**. If the first bit of the ADDRESS is 0, the preamble will be set to 0xAAAA. Otherwise the PREAMBLE will be set to 0x5555.
- For **MODE** = Ble\_LR125Kbit and **MODE** = Ble\_LR500Kbit, the PREAMBLE is 10 repetitions of 0x3C.
- For **MODE** = leee802154\_250Kbit, the PREAMBLE is 4 bytes and set to all zeros.

Radio packets are stored in memory inside instances of a RADIO packet data structure as illustrated below. The PREAMBLE, ADDRESS, CI, TERM1, TERM2, and CRC fields are omitted in this data structure. Fields S0, LENGTH, and S1 are optional.

Figure 86: In-RAM representation of RADIO packet

The byte ordering on air is always least significant byte first for the ADDRESS and PAYLOAD fields, and most significant byte first for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first. The CRC field is always transmitted and received most significant bit first. The endianness, i.e. the order in which the bits are sent and received, of the S0, LENGTH, S1, and PAYLOAD fields can be configured via **PCNF1.ENDIAN**.

The sizes of the S0, LENGTH and S1 fields can be individually configured via SOLEN, LFLEN, and S1LEN in **PCNF0** respectively. If any of these fields are configured to be less than 8 bits, the least significant bits of the fields are used.

If S0, LENGTH, or S1 are specified with zero length, their fields will be omitted in memory. Otherwise each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

Independent of the configuration of **PCNF1.MAXLEN**, the combined length of S0, LENGTH, S1, and PAYLOAD cannot exceed 258 bytes.

## 6.18.2 Address configuration

The on-air radio ADDRESS field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via **PCNF1.BALEN**. The base address is truncated from the least significant byte if the **PCNF1.BALEN** is less than 4. See [Definition of logical addresses](#) on page 279.

| Logical address | Base address | Prefix byte |
|-----------------|--------------|-------------|
| 0               | BASE0        | PREFIX0.AP0 |
| 1               | BASE1        | PREFIX0.AP1 |
| 2               | BASE1        | PREFIX0.AP2 |
| 3               | BASE1        | PREFIX0.AP3 |
| 4               | BASE1        | PREFIX1.AP4 |
| 5               | BASE1        | PREFIX1.AP5 |
| 6               | BASE1        | PREFIX1.AP6 |
| 7               | BASE1        | PREFIX1.AP7 |

Table 74: Definition of logical addresses

The on-air addresses are defined in the **BASE0/BASE1** and **PREFIX0/PREFIX1** registers. It is only when writing these registers that the user must relate to the actual on-air addresses. For other radio address registers, such as the **TXADDRESS**, **RXADDRESSES**, and **RXMATCH** registers, logical radio addresses ranging from 0 to 7 are being used. The relationship between the on-air radio addresses and the logical addresses is described in [Definition of logical addresses](#) on page 279.

### 6.18.3 Data whitening

The RADIO is able to do packet whitening and de-whitening, enabled in `PCNF1.WHITEEN`. When enabled, whitening and de-whitening will be handled by the RADIO automatically as packets are sent and received.

The whitening word is generated using polynomial  $g(D) = D^7 + D^4 + 1$ , which then is XORed with the data packet that is to be whitened, or de-whitened. See the figure below.

Figure 87: Data whitening and de-whitening

Whitening and de-whitening will be performed over the whole packet except for the preamble and the address fields.

The linear feedback shift register in the figure above is initialized via `DATAWHITEIV`.

### 6.18.4 CRC

The CRC generator in the RADIO calculates the CRC over the whole packet excluding the preamble. If desirable, the address field can be excluded from the CRC calculation as well.

See `CRC CNF` register for more information.

The CRC polynomial is configurable as illustrated in the following figure, where bit 0 in the `CRC POLY` register corresponds to  $X^0$  and bit 1 corresponds to  $X^1$  etc. See `CRC POLY` on page 325 for more information.

Figure 88: CRC generation of an  $n$  bit CRC

The figure shows that the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches  $b_0$  through  $b_n$  will be initialized with a predefined value specified in the `CRC INIT` register. After the whole packet has been clocked through the CRC generator,  $b_0$  through  $b_n$  will hold the resulting CRC. This value will be used by the RADIO during both transmission and reception. Latches  $b_0$  through  $b_n$  are not available to be read by the CPU at any time. However, a received CRC can be read by the CPU via the `RXCRC` register.

The length ( $n$ ) of the CRC is configurable, see `CRC CNF` for more information.

Once the entire packet, including the CRC, has been received and no errors were detected, the RADIO generates a `CRC OK` event. If CRC errors were detected, a `CRC ERROR` event is generated.

The status of the CRC check can be read from the [CRCSTATUS](#) register after a packet has been received.

### 6.18.5 Radio states

Tasks and events are used to control the operating state of the RADIO.

The RADIO can enter the states described the table below.

| State     | Description  |
|-----------|--|
| DISABLED  | No operations are going on inside the RADIO and the power consumption is at a minimum                |
| RXRU      | The RADIO is ramping up and preparing for reception  |
| RXIDLE    | The RADIO is ready for reception to start  |
| RX        | Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored |
| TXRU      | The RADIO is ramping up and preparing for transmission   |
| TXIDLE    | The RADIO is ready for transmission to start   |
| TX        | The RADIO is transmitting a packet   |
| RXDISABLE | The RADIO is disabling the receiver  |
| TXDISABLE | The RADIO is disabling the transmitter   |

Table 75: RADIO state diagram

A state diagram showing an overview of the RADIO is shown in the following figure.

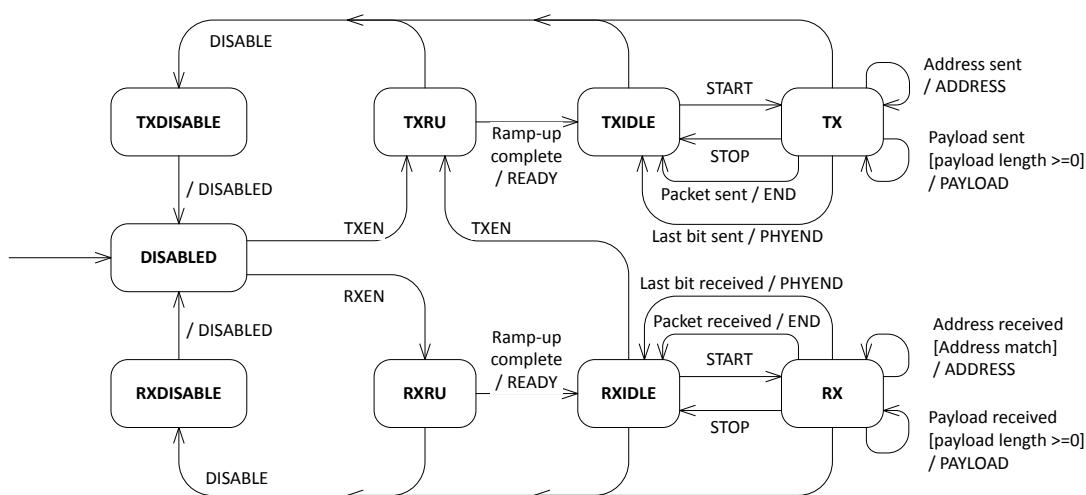

Figure 89: Radio states

This figure shows how the tasks and events relate to the RADIO's operation. The RADIO does not prevent a task from being triggered from the wrong state. If a task is triggered from the wrong state, for example if the **RXEN** task is triggered from the **RXDISABLE** state, this may lead to incorrect behavior. The **PAYLOAD** event is always generated even if the payload is zero.

The **END** to **START** shortcut should not be used with IEEE 802.15.4 250 kbps mode. Use the **PHYEND** to **START** shortcut instead.

The **END** to **START** shortcut should not be used with Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes. Use the **PHYEND** to **START** shortcut instead.

### 6.18.6 Transmit sequence

Before the RADIO is able to transmit a packet, it must first ramp-up in TX mode. See **TXRU** in [Radio states](#) on page 281 and [Transmit sequence](#) on page 282. A **TXRU** ramp-up sequence is initiated when the

**TXEN** task is triggered. After the RADIO has successfully ramped up it will generate the **READY** event indicating that a packet transmission can be initiated. A packet transmission is initiated by triggering the **START** task. The **START** task can first be triggered after the RADIO has entered into the TXIDLE state.

The following figure illustrates a single packet transmission where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **END** and **DISABLE**. As illustrated in [Transmit sequence](#) on page 282 the RADIO will by default transmit '1's between **READY** and **START**, and between **END** and **DISABLE**. What is transmitted can be programmed through the DTX field in the **MODECNF0** register.

Figure 90: Transmit sequence

The following figure shows a slightly modified version of the transmit sequence where the RADIO is configured to use shortcuts between **READY** and **START**, and between **END** and **DISABLE**, which means that no delay is introduced.

Figure 91: Transmit sequence using shortcuts to avoid delays

The RADIO is able to send multiple packets one after the other without having to disable and re-enable the RADIO between packets, as illustrated in the following figure.

Figure 92: Transmission of multiple packets

### 6.18.7 Receive sequence

Before the RADIO is able to receive a packet, it must first ramp up in RX mode, see RXRU in [Radio states](#) on page 281 and [Receive sequence](#) on page 283.

An RXRU ramp up sequence is initiated when the [RXEN](#) task is triggered. After the RADIO has successfully ramped up it will generate the [READY](#) event indicating that a packet reception can be initiated. A packet reception is initiated by triggering the [START](#) task. As illustrated in [Radio states](#) on page 281, the [START](#) task can first be triggered after the RADIO has entered into the RXIDLE state.

The following figure shows a single packet reception where the CPU manually triggers the different tasks needed to control the flow of the RADIO, i.e. no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between [READY](#) and [START](#), and between [END](#) and [DISABLE](#). The RADIO will be listening and possibly receiving undefined data, represented with an 'X', from [START](#) and until a packet with valid preamble (P) is received.

Figure 93: Receive sequence

The following figure shows a slightly modified version of the receive sequence, where the RADIO is configured to use shortcuts between [READY](#) and [START](#), and between [END](#) and [DISABLE](#), which means that no delay is introduced.

Figure 94: Receive sequence using shortcuts to avoid delays

The RADIO is able to receive consecutive packets without having to disable and re-enable the RADIO between packets, as illustrated in the figure below.

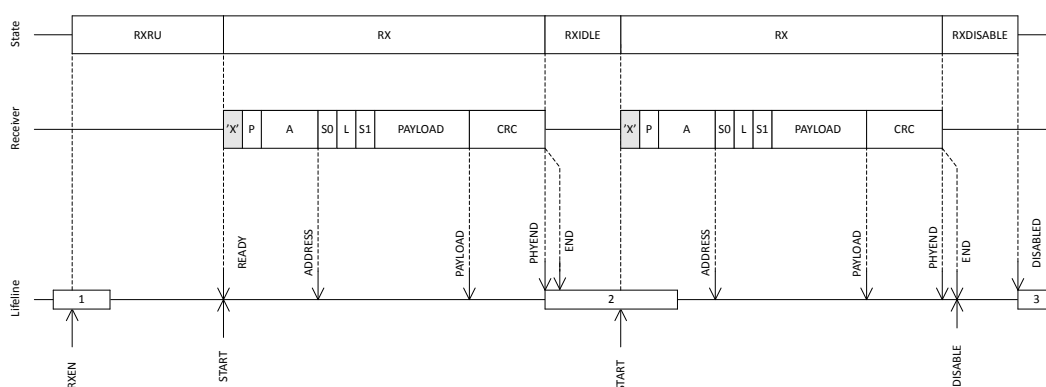

Figure 95: Reception of multiple packets

### 6.18.8 Received signal strength indicator (RSSI)

The RADIO implements a mechanism for measuring the power in the received signal. This feature is called received signal strength indicator (RSSI).

The RSSI is measured continuously and the value filtered using a single-pole IIR filter. After a signal level change, the RSSI will settle after approximately  $RSSI_{SETTLE}$ .

Sampling of the received signal strength is started by using the `RSSISTART` task. The sample can be read from the `RSSISAMPLE` register.

The sample period of the RSSI is defined by  $RSSI_{PERIOD}$ . The `RSSISAMPLE` will hold the filtered received signal strength after this sample period.

For the RSSI sample to be valid, the RADIO has to be enabled in receive mode (`RXEN` task) and the reception has to be started (`READY` event followed by `START` task).

### 6.18.9 Interframe spacing (IFS)

Interframe spacing (IFS) is defined as the time, in microseconds, between two consecutive packets, starting from when the end of the last bit of the previous packet is received, to the beginning of the first bit of the subsequent packet that is transmitted. The RADIO is able to enforce this interval, as specified in the `TIFS` register, as long as the `TIFS` is not specified to be shorter than the RADIO's turnaround time, i.e.

the time needed to switch off the receiver, and then switch the transmitter back on. The **TIFS** register can be written any time before the last bit on air is received.

This timing is illustrated in the figure below.

Figure 96: IFS timing detail

The TIFS duration starts after the last bit on air (just before the **END** event), and elapses with first bit being transmitted on air (just after **READY** event).

TIFS is only enforced if the shortcuts **END** to **DISABLE** and **DISABLED** to **TXEN** or **END** to **DISABLE** and **DISABLED** to **RXEN** are enabled.

TIFS is qualified for use in IEEE 802.15.4 250kbps mode, Long Range (125 kbps and 500 kbps) *Bluetooth*<sup>®</sup> Low Energy modes, 1 Mbps and 2 Mbps *Bluetooth*<sup>®</sup> Low Energy modes, using the default ramp-up mode.

**SHORTS** and **TIFS** registers are not double-buffered, and can be updated at any point before the last bit on air is received. The **MODE** register is double-buffered and sampled at the **TXEN** or **RXEN** task.

### 6.18.10 Device address match

The device address match feature is tailored for address whitelisting in *Bluetooth*<sup>®</sup> low energy and similar implementations.

This feature enables on-the-fly device address matching while receiving a packet on air. This feature only works in receive mode and when the RADIO is configured for little endian, see **PCNF1.ENDIAN**.

The device address match unit assumes that the first 48 bits of the payload are the device address and that bit number 6 in S0 is the TxAdd bit. See the *Bluetooth*<sup>®</sup> Core Specification for more information about device addresses, TxAdd, and whitelisting.

The RADIO is able to listen for eight different device addresses at the same time. These addresses are specified in a DAB/DAP register pair, one pair per address, in addition to a TxAdd bit configured in the DACNF register. The DAB register specifies the 32 least significant bits of the device address, while the DAP register specifies the 16 most significant bits of the device address.

Each of the device addresses can be individually included or excluded from the matching mechanism. This is configured in the **DACNF** register.

### 6.18.11 Bit counter

The RADIO implements a simple counter that can be configured to generate an event after a specific number of bits have been transmitted or received.

By using shortcuts, this counter can be started from different events generated by the RADIO and count relative to these.

The bit counter is started by triggering the **BCSTART** task, and stopped by triggering the **BCSTOP** task. A **BCMATCH** event will be generated when the bit counter has counted the number of bits specified in the **BCC** register. The bit counter will continue to count bits until the **DISABLED** event is generated or until the **BCSTOP** task is triggered. The CPU can therefore, after a **BCMATCH** event, reconfigure the **BCC** value for new **BCMATCH** events within the same packet.

The bit counter can only be started after the RADIO has received the **ADDRESS** event.

The bit counter will stop and reset on either the **BCSTOP**, **STOP**, or **DISABLE** task, or the **END** event.

The figure below illustrates how the bit counter can be used to generate a **BCMATCH** event in the beginning of the packet payload, and again generate a second **BCMATCH** event after sending 2 bytes (16 bits) of the payload.

Figure 97: Bit counter example

### 6.18.12 Direction finding

The RADIO implements the Angle-of-Arrival (AoA) and Angle-of-Departure (AoD) Bluetooth Low Energy feature, which can be used to determine the direction of a peer device. The feature is available for the BLE 1 Mbps and BLE 2 Mbps modes.

When using this feature, the transmitter sends a packet with a continuous tone extension (CTE) appended to the packet, after the CRC. During the CTE, the receiver can take IQ samples of the incoming signal.

An antenna array is employed at the transmitter (AoD) or at the receiver (AoA). The AoD transmitter, or AoA receiver, switches between the antennas, in order to collect IQ samples from the different antenna pairs. The IQ samples can be used to calculate the relative path lengths between the antenna pairs, which can be used to estimate the direction of the transmitter.

#### 6.18.12.1 CTE format

The CTE is from 16  $\mu$ s to 160  $\mu$ s and consists of an unwhitened sequence of 1's, equivalent to a continuous tone nominally offset from the carrier by +250 kHz for the 1 Mbps PHY and +500 kHz for the 2 Mbps BLE PHYs. The format of the CTE, when switching and/or sampling, is shown below.

Figure 98: Constant tone extension (CTE) structure

Antenna switching is performed during switch slots and the guard period. The AoA/AoD feature requires that one IQ sample is taken for each microsecond within the reference period, and once for each sample slot. Oversampling is possible by changing the sample spacing as described in [IQ sampling](#) on page 290. The switch slot and sample slot durations are either 1 or 2  $\mu\text{s}$ , but must be equal. The format of the CTE and switching and sampling procedures may be configured prior to, or during, packet transmission and reception. Alternatively, during packet reception, these operations can be configured by reading specific fields of the packet contents.

### 6.18.12.2 Mode

Depending on the [DFEMODE](#), the device performs the following procedures:

|   | DFEMODE |    |     |    |
|---|---------|----|-----|----|
|   | AOA     |    | AOD |    |
|   | TX      | RX | TX  | RX |
| Generating and transmitting CTE           | x       |    | x   |    |
| Receiving, interpreting, and sampling CTE |         | x  |     | x  |
| Antenna switching                         |         | x  | x   |    |

Table 76: AoA/AoD Procedures performed as a function of DFEMODE and TX/RX mode

### 6.18.12.3 Inline configuration

When inline configuration is enabled during RX, further configuration of the AoA/AoD procedures is performed based on the values of the CP bit and the CTEInfo octet within the packet. This is enabled by setting [CTEINLINECONF.CTEINLINCTRLLEN](#). The CTEInfo octet is present only if the CP bit is set. The position of the CP bit and CTEInfo octet depends on whether the packet has a *Data Channel PDU* ([CTEINLINECONF.CTEINFOINS1=InS1](#)), or an *Advertising Channel PDU* ([CTEINLINECONF.CTEINFOINS1=NotInS1](#)).

#### Data channel PDU

For Data Channel PDUs, [PCNF0.SOLEN](#) must be 1 byte, and [PCNF0.LFLEN](#) must be 8 bits. To determine if S1 is present, the registers [CTEINLINECONF.S0MASK](#) and [CTEINLINECONF.S0CONF](#) forms a bitwise mask-and-test for the S0 field. If the bitwise AND between S0 and S0MASK equals S0CONF, then S1 is determined to be present. When present, the value of [PCNF0.S1LEN](#) will be ignored, as this is decided by the CP bit in the the following figure.

Figure 99: Data channel PDU header

When encrypting and decrypting BLE packets using the [CCM](#) peripheral, it is also required to set [PCNF0.S1INCL=1](#). The CCM mode must be configured to use an 8-bit length field. The value of the CP bit is included in the calculation of the MIC, while the S1 field is ignored by the CCM calculation.

## Advertising channel PDU

For advertising channel PDUs, the CTEInfo Flag replaces the CP bit. The CTEInfo Flag is within the extended header flag field in some of the advertising PDUs that employ the common extended advertising payload format (i.e. AUX\_SYNC\_IND, AUX\_CHAIN\_IND). The format of such packets is shown in the following figure.

Figure 100: Advertising channel PDU header

The [CTEINLINECONF.SOCONF](#) and [CTEINLINECONF.SOMASK](#) fields can be configured to accept only certain advertising PDU Types. If the extended header length is non-zero, the CTEInfo extended header flag is checked to determine whether CTEInfo is present. If a bit before the CTEInfo flag within the extended header flags is set, then the CTEInfo position is postponed 6 octets.

## CTEInfo parsing

The CTEInfo field is shown in the following figure.

Figure 101: CTEInfo field

The CTETIME field defines the length of the CTE in 8  $\mu$ s units. The valid upper bound of values can be adjusted using [CTEINLINECONF.CTETIMEVALIDRANGE](#), including allowing use of the RFU bit within this field. If the CTETIME field is an invalid value of either 0 or 1, the CTE is assumed to be the minimum valid length of 16  $\mu$ s. The slot duration is determined by the CTEType field. In RX this determines whether the sample spacing as defined in [CTEINLINECONF.CTEINLINERXMODE1US](#) or [CTEINLINECONF.CTEINLINERXMODE2US](#) is used.

| CTEType | Description             | TX switch spacing | RX sample spacing during reference period | Sample spacing RX during reference period |
|---------|-------------------------|-------------------|---|---|
| 0       | AoA, no switching       | -                 | TSAMPLESPACING1                           | TSAMPLESPACING2                           |
| 1       | AoD, 1 $\mu$ s slots    | 2 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE1US                        |
| 2       | AoD, 2 $\mu$ s slots    | 4 $\mu$ s         | TSAMPLESPACING1                           | CTEINLINERXMODE2US                        |
| 3       | Reserved for future use |                   |   |   |

Table 77: Switching and sampling spacing based on CTEType

### 6.18.12.4 Manual configuration

If [CTEINLINECONF.CTEINLINECTRLLEN](#) is not set, then the packet is not parsed to determine the CTE parameters, and the antenna switching and sampling is controlled by other registers, see [Antenna switching](#) on page 289. The length of the CTE is given in 8  $\mu$ s units by [DFCTRL1.NUMBEROF8US](#). The start of the antenna switching and/or sampling (denoted as an AoA/AoD procedure), can be configured to start at some trigger with an additional offset. Using [DFCTRL1.DFEINEXTENSION](#), the trigger can be configured to be the end of the CRC, or alternatively, the ADDRESS event. The additional offset for antenna switching is configured using [DFCTRL2.TSWITCHOFFSET](#). Similarly, the additional offset for antenna sampling is configured using [DFCTRL2.TSAMPLEOFFSET](#).

### 6.18.12.5 Receive- and transmit sequences

The addition of the CTE to the transmitted packet is illustrated in the following figure.

Figure 102: Transmit sequence with DFE

The presence of CTE within a received packet is signalled by the **CTEPRESENT** event illustrated in the figure below.

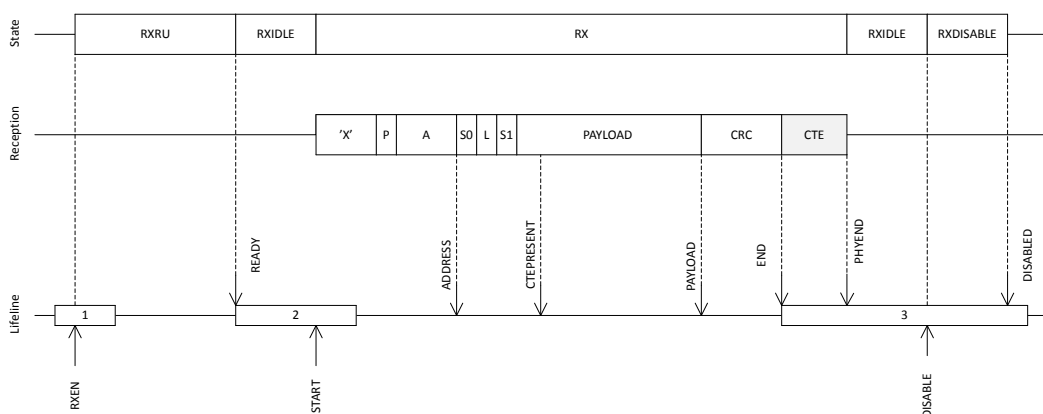

Figure 103: Receive sequence with DFE

### 6.18.12.6 Antenna switching

The RADIO can control up to 8 GPIO pins in order to control external antenna switches used in direction finding.

#### Pin configuration

The eight antenna selection signals are mapped to physical pins according to the pin numbers specified in the PSEL.DFEGPIO[n] registers. Only pins that have the PSEL.DFEGPIO[n].CONNECTED field set to *Connected* will be controlled by the RADIO. Pins that are *Disconnected* will be controlled by GPIO.

During transmission in AoD TX mode or reception in AoA RX mode, the RADIO automatically acquires the pins as needed. At times when the RADIO does not use the pin, the pin is released to its default state and controlled by the **GPIO** configuration. Thus, the pin must be configured using the **GPIO** peripheral.

| Pin acquired by RADIO | Direction                      | Value                                   | Comment  |
|-----------------------|--------------------------------|---|--|
| Yes                   | Output                         | Specified in <code>SWITCHPATTERN</code> | Pin acquired by RADIO, and in use for DFE.   |
| No                    | Specified by <code>GPIO</code> | Specified by <code>GPIO</code>          | DFE not in progress. Pin has not been acquired by RADIO, but is available for DFE use. |

Table 78: Pin configuration matrix for a connected and enabled pin [n]

## Switch pattern configuration

The values of the GPIOs while switching during the CTE are configured by writing successively to the `SWITCHPATTERN` register. The first write to `SWITCHPATTERN` is the GPIO pattern applied from the call of `TASKS_TXEN` or `TASKS_RXEN` until the first antenna switch is triggered. The second write sets the pattern for the reference period and is applied at the start of the guard period. The following writes set the pattern for the remaining switch slots and are applied at the start of each switch slot. If writing beyond the total number of antenna slots, the pattern will wrap to `SWITCHPATTERN[2]` and start over again. During operation, when the end of the `SWITCHPATTERN` buffer is reached, the RADIO cycles back to `SWITCHPATTERN[2]`. At the end of the AoA/AoD procedure, `SWITCHPATTERN[0]` is applied to `DFECTRL1.TSWITCHSPACING` after the previous antenna switch. The `SWITCHPATTERN` buffer can be erased/cleared using `CLEARPATTERN`.

A minimum number of three patterns must be written to the `SWITCHPATTERN` register.

If `CTEINLINECONF.CTEINLINECTRLEN` is not set, then the antenna switch spacing is determined by `DFECTRL1.TSWITCHSPACING` (otherwise described by [Switching and sampling spacing based on CTEType](#) on page 288). `DFECTRL2.TSWITCHOFFSET` determines the position of the first switch compared to the configurable start of CTE (see `DFECTRL1.DFEINEXTENSION`).

### 6.18.12.7 IQ sampling

The RADIO uses DMA to write IQ samples recorded during the CTE to RAM. Alternatively, the magnitude and phase of the samples can be recorded using the `DFECTRL1.SAMPLETYPE` field. The samples are written to the location in RAM specified by `DFEPACKET.PTR`. The maximum number of samples to transfer are specified by `DFEPACKET.MAXCNT` and the number of samples transferred are given in `DFEPACKET.AMOUNT`. The IQ samples are recorded with respect to the RX carrier frequency. The format of the samples is provided in the following table.

| SAMPLETYPE       | Field     | Bits  | Description   |
|------------------|-----------|-------|---|
| 0: I_Q (default) | Q         | 31:16 | 12 bits signed, sign extended to 16 bits  |
|                  | I         | 15:0  |   |
| 1: MagPhase      | reserved  | 31:29 | Always zero   |
|                  | magnitude | 28:16 | 13 bits unsigned. Equals $1.646756 * \sqrt{I^2 + Q^2}$  |
|                  | phase     | 15:0  | 9 bits signed, sign extended to 16 bits. Equals $64 * \text{atan2}(Q, I)$ in the range [-201,201] |

Table 79: Format of samples

Oversampling is configured separately for the reference period and for the time after the reference period. During the reference period, the sample spacing is determined by `DFECTRL1.TSAMPLESPACINGREF`. `DFECTRL2.TSAMPLEOFFSET` determines the position of the first sample relative to the end of the last bit of the CRC.

For the time after the reference period, if `CTEINLINECONF.CTEINLINECTRLEN` is disabled, the sample spacing is set in `DFECTRL1.TSAMPLESPACING`. However, when `CTEINLINECONF.CTEINLINECTRLEN` is enabled, the sample spacing are determined by two different registers, depending on whether the device is in AoA or AoD RX-mode, as follows.

For AoD RX mode, the sample spacing after the reference period is determined by the `CTEType` in the packet, as listed in the table below.

| CTEType             | Sample spacing                   |
|---------------------|----------------------------------|
| AoD 1 $\mu$ s slots | CTEINLINECONF.CTEINLINERXMODE1US |
| AoD 2 $\mu$ s slots | CTEINLINECONF.CTEINLINERXMODE2US |
| Other               | DFECTRL1.TSAMPLESPACING          |

Table 80: Sample spacing when CTEINLINECONF.CTEINLINECTRLLEN is set and the device is in AoD RX mode

For AoA RX mode, the sample spacing after the reference period is determined by DFECTRL1.TSWITCHSPACING, as listed in the table below.

| DFECTRL1.TSWITCHSPACING | Sample spacing                   |
|-------------------------|----------------------------------|
| 2 $\mu$ s               | CTEINLINECONF.CTEINLINERXMODE1US |
| 4 $\mu$ s               | CTEINLINECONF.CTEINLINERXMODE2US |
| Other                   | DFECTRL1.TSAMPLESPACING          |

Table 81: Sample spacing when CTEINLINECONF.CTEINLINECTRLLEN is set and the device is in AoA RX mode

For the reference- and switching periods, DFECTRL1.TSAMPLESPACINGREF and DFECTRL1.TSAMPLESPACING can be used to achieve oversampling.

### 6.18.13 IEEE 802.15.4 operation

With the MODE=ieee802154\_250kbit the RADIO will comply with the IEEE 802.15.4-2006 standard implementing its 250 kbps, 2450 MHz, O-QPSK PHY.

The IEEE 802.15.4 standard differs from Nordic's proprietary and *Bluetooth*<sup>®</sup> low energy modes. Notable differences include modulation scheme, channel structure, packet structure, security, and medium access control.

The main features of the IEEE 802.15.4 mode are:

- Ultra-low power 250 kbps, 2450 MHz, IEEE 802.15.4-2006 compliant link
- Clear channel assessment
- Energy detection scan
- CRC generation

#### 6.18.13.1 Packet structure

The IEEE 802.15.4 standard defines an on-the-air frame/packet that is different from what is used in BLE mode.

The following figure provides an overview of the physical frame structure and its timing.

Figure 104: IEEE 802.15.4 frame format (PPDU)

The standard uses the term *octet* for an 8-bit storage unit within the PPDU. For timing, the value *symbol* is used, and it has a duration of 16  $\mu$ s.

The total usable payload (PSDU) is 127 octets, but when CRC is in use, this is reduced to 125 octets of usable payload.

The preamble sequence consists of four octets that are all zero, and are used for synchronizing the RADIO's receiver. Following the preamble is the single octet *start of frame delimiter (SFD)*, with a fixed value of 0xA7. An alternate SFD can be programmed through the **SFD** register, providing an initial level of frame filtering for those who choose non-standard compliance. It is a valuable feature when operating in a congested or private network. The preamble sequence and the SFD are generated by the RADIO, and are not programmed by the user into the frame buffer.

Following the five octet *synchronization header (SHR)* is the single octet *phy header (PHR)*. The least significant seven bits of PHR denote the frame length of the following PSDU. The most significant bit is reserved and is set to zero for frames that are standard compliant. The RADIO reports all eight bits which can be used to carry additional information. The PHR is the first byte written to the frame data memory pointed to by **PACKETPTR**. Frames with zero length are discarded, and the **FRAMESTART** event is not generated in this case.

The next N octets carry the data of the PHY packet, where N equals the value of the PHR. For an implementation also using the IEEE 802.15.4 MAC layer, the PHY data is a MAC frame of N-2 octets, since two octets occupy a CRC field.

As illustrated in the figure below, an IEEE 802.15.4 MAC layer frame always consists of

- A header:
  - The frame control field (FCF)
  - The sequence number
  - Addressing fields
- A payload
- The 16-bit frame control sequence (FCS)

Figure 105: IEEE 802.15.4 frame format (MPDU)

The two FCF octets contain information about the frame type, addressing, and other control flags. This field is decoded when using the assisted operating modes offered by the RADIO.

The sequence number is a single octet in size and is unique for a frame. It is used in the associated acknowledgement frame sent upon successful frame reception.

The addressing field can be zero (acknowledgement frame) or up to 20 octets in size. The field is used to direct packets to the correct recipient and denote its origin. IEEE 802.15.4 bases its addressing on networks being organized in PANs with 16-bit identifier and nodes having a 16-bit or 64-bit address. In the assisted receive mode, these parameters are analyzed for address matching and acknowledgement.

The MAC payload carries the data of the next higher layer, or in the case of a MAC command frame, information used by the MAC layer itself.

The two last octets contain the 16-bit ITU-T CRC. The FCS is calculated over the MAC header (MHR) and MAC payload (MSDU) parts of the frame. This field is calculated automatically when sending a frame, or indicated in the `CRCSTATUS` register when a frame is received. If configured, this feature is taken care of autonomously by the CRC module.

### 6.18.13.2 Operating frequencies

The IEEE 802.15.4 standard defines 16 channels, 11 - 26, of 5 MHz each, in the 2450 MHz frequency band.

To choose the correct channel center frequency, the `FREQUENCY` register must be programmed according to the table below.

| IEEE 802.15.4 channel | Center frequency (MHz) | FREQUENCY setting |
|-----------------------|------------------------|-------------------|
| Channel 11            | 2405                   | 5                 |
| Channel 12            | 2410                   | 10                |
| Channel 13            | 2415                   | 15                |
| Channel 14            | 2420                   | 20                |
| Channel 15            | 2425                   | 25                |
| Channel 16            | 2430                   | 30                |
| Channel 17            | 2435                   | 35                |
| Channel 18            | 2440                   | 40                |
| Channel 19            | 2445                   | 45                |
| Channel 20            | 2450                   | 50                |
| Channel 21            | 2455                   | 55                |
| Channel 22            | 2460                   | 60                |
| Channel 23            | 2465                   | 65                |
| Channel 24            | 2470                   | 70                |
| Channel 25            | 2475                   | 75                |
| Channel 26            | 2480                   | 80                |

Table 82: IEEE 802.15.4 center frequency definition

### 6.18.13.3 Energy detection (ED)

As required by the IEEE 802.15.4 standard, it must be possible to sample the received signal power within the bandwidth of a channel, for the purpose of determining presence of activity.

To prevent the channel signal from being decoded, the shortcut between the `READY` event and the `START` task should be disabled before putting the RADIO in receive mode. The energy detection (ED) measurement time, where RSSI samples are averaged, is 8 symbol periods, corresponding to 128  $\mu$ s. The standard further specifies the measurement to be a number between 0 and 255, where 0 shall indicate received power less than 10 dB above the selected receiver sensitivity. The power range of the ED values must be at least a 40 dB linear mapping with accuracy of  $\pm 6$  dB. See section 6.9.7 *Receiver ED* in the IEEE 802.15.4 standard for further details.

The following example shows how to perform a single energy detection measurement and convert to IEEE 802.15.4 scale.

**IEEE 802.15.4 ED measurement example**

```

#define ED_RSSISCALE 4 // From electrical specifications
uint8_t sample_ed(void)
{
    int val;
    NRF_RADIO->TASKS_EDSTART = 1; // Start
    while (NRF_RADIO->EVENTS_EDEND != 1) {
        // CPU can sleep here or do something else
        // Use of interrupts are encouraged
    }
    val = NRF_RADIO->EDSAMPLE; // Read level
    return (uint8_t)(val>63 ? 255 : val*ED_RSSISCALE); // Convert to IEEE
    802.15.4 scale
}

```

For scaling between hardware value and dBm, see equation [Conversion between hardware value and dBm](#) on page 296.

The `mlme-scan.req` primitive of the MAC layer uses the ED measurement to detect channels where there might be wireless activity. To assist this primitive, a tailored mode of operation is available where the ED measurement runs for a defined number of iterations keeping track of the maximum ED level. This is engaged by writing the `EDCNT` register to a value different from 0, where it will run the specified number of iterations and report the maximum energy measurement in the `EDSAMPLE` register. The scan is started with `EDSTART` task and its end indicated with the `EDEND` event. This significantly reduces the interrupt frequency and therefore power consumption. The following figure shows how the ED measurement will operate depending on the `EDCNT` register.

**EDCNT = 0****EDCNT = N-1**

Figure 106: Energy detection measurement examples

The scan is stopped by writing the `EDSTOP` task. It will be followed by the `EDSTOPPED` event when the module has terminated.

### 6.18.13.4 Clear channel assessment (CCA)

IEEE 802.15.4 implements a listen-before-talk channel access method to avoid collisions when transmitting, known as *carrier sense multiple access with collision avoidance (CSMA-CA)*. The key part of this is measuring if the wireless medium is busy or not.

The following clear channel assesment modes are supported:

- **CCA Mode 1** (energy above threshold): The medium is reported busy upon detecting any energy above the ED threshold.
- **CCA Mode 2** (carrier sense only): The medium is reported busy upon detection of a signal compliant with the IEEE 802.15.4 standard with the same modulation and spreading characteristics.
- **CCA Mode 3** (carrier sense with energy above threshold): The medium is reported busy using a logical combination (AND/OR) between the results from CCA Mode 1 and CCA Mode 2.

The clear channel assessment should survey a period equal to 8 symbols or 128  $\mu$ s.

The RADIO must be in receive mode and be able to receive correct packets when performing the CCA. The shortcut between **READY** and **START** must be disabled if baseband processing is not to be performed while the measurement is running.

## CCA Mode 1

**CCA Mode 1** is enabled by first configuring the field **CCACTRL.CCAMODE**=EdMode and writing the **CCACTRL.CCAEDTHRES** field to a chosen value. Once the **CCASTART** task is written, the RADIO will perform a ED measurement for 8 symbols and compare the measured level with that found in the **CCACTRL.CCAEDTHRES** field. If the measured value is higher than or equal to this threshold, the **CCABUSY** event is generated. If the measured level is less than the threshold, the **CCAIDLE** event is generated.

## CCA Mode 2

**CCA Mode 2** is enabled by configuring **CCACTRL.CCAMODE**=CarrierMode. The RADIO will sample to see if a valid SFD is found during the 8 symbols. If a valid SFD is detected, the **CCABUSY** event is generated and the device should not send any data. The **CCABUSY** event is also generated if the scan was performed during an ongoing frame reception. In the case where the measurement period completes with no SFD detection, the **CCAIDLE** event is generated. With **CCACTRL.CCACORRCNT** not being zero, the algorithm will look at the correlator output in addition to the SFD detection signal. If a SFD is reported during the scan period, it will terminate immediately indicating busy medium. Similarly, if the number of peaks above **CCACTRL.CCACORRTHRES** crosses the **CCACTRL.CCACORRCNT**, the **CCACTRL.CCABUSY** event is generated. If less than **CCACORRCOUNT** crossings are found and no SFD is reported, the **CCAIDLE** event will be generated and the device can send data.

## CCA Mode 3

**CCA Mode 3** is enabled by configuring **CCACTRL.CCAMODE**=CarrierAndEdMode or **CCACTRL.CCAMODE**=CarrierOrEdMode, performing the required logical combination of the result from CCA Mode 1 and 2. The **CCABUSY** or **CCAIDLE** events are generated by ANDing or ORing the *energy above threshold* and *carrier detection* scans.

## Shortcuts

An ongoing CCA can always be stopped by issuing the **CCASTOP** task. This will trigger the associated **CCASTOPPED** event.

For CCA mode automation, a number of shortcuts are available.

- To automatically switch between RX (when performing the CCA) and to TX where the packet is sent, the shortcut between **CCAIDLE** and **TXEN**, in conjunction with the short between **CCAIDLE** and **STOP** must be used.

- To automatically disable the RADIO whenever the CCA reports a busy medium, the shortcut between [CCABUSY](#) and [DISABLE](#) can be used.
- To immediately start a CCA after ramping up into RX mode, the shortcut between [RXREADY](#) and [CCASTART](#) can be used.

## Conversion

The conversion from a CCAEDTHRES, CCA, or EDLEVEL value to dBm can be done with the following equation, where  $VAL_{\text{HARDWARE}}$  is the hardware-reported values, being either CCAEDTHRES, CCA or EDLEVEL, and constants ED\_RSSISCALE and ED\_RSSIOFFS are from electrical specifications.

$$P_{\text{RF}}[\text{dBm}] = \text{ED\_RSSIOFFS} + \text{ED\_RSSISCALE} \times \text{VAL}_{\text{HARDWARE}}$$

Figure 107: Conversion between hardware value and dBm

### 6.18.13.5 Cyclic redundancy check (CRC)

IEEE 802.15.4 uses a 16-bit ITU-T cyclic redundancy check (CRC) calculated over the MAC header (MHR) and MAC service data unit (MSDU).

The standard defines the following generator polynomial:

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

In receive mode the RADIO will trigger the CRC module when the first octet after the frame length (PHR) is received. The CRC will then update on each consecutive octet received. When a complete frame is received the [CRCSTATUS](#) register will be updated accordingly and the [CRCOK](#) or [CRCERROR](#) events generated. When the CRC module is enabled it will not write the two last octets (CRC) to the frame Data RAM. When transmitting, the CRC will be computed on the fly, starting with the first octet after PHR, and inserted as the two last octets in the frame. The EasyDMA will fetch frame length minus 2 octets from RAM and insert the CRC octets insitu.

Below is a code snippet for configuring the CRC module for correct operation when in IEEE 802.15.4 mode. The [CRCCNF](#) is written to 16-bit CRC and the [CRCPOLY](#) is written to 0x11021. The start value used by IEEE 802.15.4 is zero and [CRCINIT](#) is configured to reflect this.

```
/* 16-bit CRC with ITU-T polynomial with 0 as start condition*/
NRF_RADIO->CRCCNF = ((RADIO_CRC CNF_SKIPADDR_Ieee802154 << RADIO_CRC CNF_SKIPADDR_Pos) |
                    (RADIO_CRC CNF_LEN_Two << RADIO_CRC CNF_LEN_Pos));
NRF_RADIO->CRCPOLY = 0x11021;
NRF_RADIO->CRCINIT = 0;
```

The ENDIANESS subregister must be set to little-endian since the FCS field is transmitted from left bit to right.

### 6.18.13.6 Transmit sequence

The transmission is started by first putting the RADIO in receive mode and triggering the [RXEN](#) task.

An outline of the IEEE 802.15.4 transmission is illustrated in the figure below.

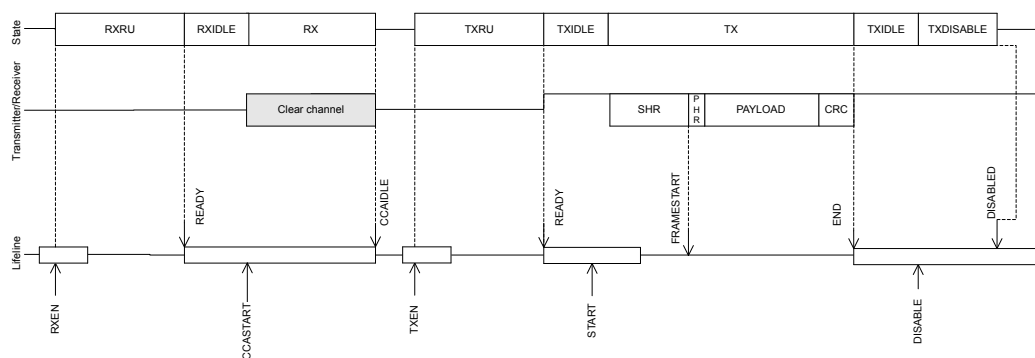

Figure 108: IEEE 802.15.4 transmit sequence

The receiver will ramp up and enter the RXIDLE state where the **READY** event is generated. Upon receiving the ready event, the CCA is started by triggering the **CCASTART** task. The chosen mode of assessment (**CCACTRL.CCAMODE** register) will be performed and signal the **CCAIDLE** or **CCABUSY** event 128  $\mu$ s later. If the **CCABUSY** event is received, the RADIO will have to retry the CCA after a specific back-off period. This is outlined in the *IEEE 802.15.4 standard, Figure 69 in section 7.5.1.4 The CSMA-CA algorithm*.

If the **CCAIDLE** event is generated, a write to the **TXEN** task register enters the RADIO in TXRU state. The **READY** event will be generated when the RADIO is in TXIDLE state and ready to transmit. With the **PACKETPTR** pointing to the length (PHR) field of the frame, the **START** task can be written. The RADIO will send the four octet preamble sequence followed by the start of frame delimiter (**SFD** register). The first byte read from the Data RAM is the length field (PHR) followed by the transmission of the number of bytes indicated as the frame length. If the CRC module is configured it will run for PHR-2 octets. The last two octets will be substituted with the results from running the CRC. The necessary CRC parameters are sampled on the **START** task. The FCS field of the frame is little endian.

In addition to the already available shortcuts, one is provided between **READY** event and **CCASTART** task so that a CCA can automatically start when the receiver is ready. A second shortcut has been added between **CCAIDLE** event and the **TXEN** task, so that upon detecting a clear channel the RADIO can immediately enter transmit mode.

### 6.18.13.7 Receive sequence

The reception is started by first putting the RADIO in receive mode. After writing to the **RXEN** task, the RADIO will start ramping up and enter the RXRU state.

When the **READY** event is generated, the RADIO enters the RXIDLE mode. For the baseband processing to be enabled, the **START** task must be written. An outline of the IEEE 802.15.4 reception can be found in the figure below.

Figure 109: IEEE 802.15.4 receive sequence

When a valid SHR is received the RADIO will start storing future octets (starting with PHR) to the data memory pointed to by `PACKETPTR`. After the SFD octet is received the `FRAMESTART` event is generated. If the CRC module is enabled it will start updating with the second byte received (first byte in payload) and run for the full frame length. The two last bytes in the frame are not written to RAM when CRC is configured. However, if the result of the CRC after running the full frame is zero, the `CRCOK` event will be generated. The `END` event is generated when the last octet has been received and is available in data memory.

When a packet is received a link quality indicator (LQI) is also generated and appended immediately after the last received octet. When using an IEEE 802.15.4 compliant frame, this will be just after the MSDU since the FCS is not reported. In the case of a non-compliant frame it will be appended after the full frame. The LQI reported by hardware must be converted to IEEE 802.15.4 range by an 8-bit saturating multiplication by 4, as shown in [IEEE 802.15.4 ED measurement example](#) on page 294. The LQI is only valid for frames equal to or longer than three octets. When receiving a frame the RSSI (reported as negative dB) will be measured at three points during the reception. These three values will be sorted and the middle one selected (median 3) to be remapped within the LQI range. The following figure illustrates the LQI measurement and how the data is arranged in data memory.

Figure 110: IEEE 802.15.4 frame in data memory

A shortcut has been added between the **FRAMESTART** event and the **BCSTART** task. This can be used to trigger a **BCMATCH** event after N bits, such as when inspecting the MAC addressing fields.

### 6.18.13.8 Interframe spacing (IFS)

The IEEE 802.15.4 standard defines a specific time that is allotted for the MAC sublayer to process received data. Interframe spacing (IFS) is used to prevent that two frames are transmitted too close together. If the transmission is requesting an acknowledgement, the space before the second frame shall be at least one IFS period.

The IFS is determined to be one of the following:

- IFS equals `macMinSIFSPeriod` (12 symbols) if the MPDU is less than or equal to `aMaxSIFSFrameSize` (18 octets) octets
- IFS equals `macMinLIFSPeriod` (40 symbols) if the MPDU is larger than `aMaxSIFSFrameSize`

Using the efficient assisted modes in the RADIO, the **TIFS** will be programmed with the correct value based on the frame being transmitted. If the assisted modes are not being used the user must update the **TIFS** register manually. The figure below provides details on what IFS period is valid in both acknowledged and unacknowledged transmissions.

Figure 111: Interframe spacing examples

### 6.18.14 EasyDMA

The RADIO uses EasyDMA to read and write packets to RAM without CPU involvement.

As illustrated in [RADIO block diagram](#) on page 278, the RADIO's EasyDMA utilizes the same [PACKETPTR](#) for receiving and transmitting packets. This pointer should be reconfigured by the CPU each time before RADIO is started by the [START](#) task. The [PACKETPTR](#) register is double-buffered, meaning that it can be updated and prepared for the next transmission.

The [END](#) event indicates that the last bit has been processed by the RADIO. The [DISABLED](#) event is issued to acknowledge that a [DISABLE](#) task is done.

The structure of a packet is described in detail in [Packet configuration](#) on page 278. The data that is stored in Data RAM and transported by EasyDMA consists of the following fields:

- S0
- LENGTH
- S1
- PAYLOAD

In addition, a static add-on is sent immediately after the payload.

The size of each of the above fields in the frame is configurable (see [Packet configuration](#) on page 278), and the space occupied in RAM depends on these settings. The size of the field can be zero, as long as the resulting frame complies with the chosen RF protocol.

All fields are extended in size to align with a byte boundary in RAM. For instance, a 3-bit long field on air will occupy 1 byte in RAM while a 9-bit long field will be extended to 2 bytes.

The packet's elements can be configured as follows:

- CI, TERM1, and TERM2 fields are only present in *Bluetooth*<sup>®</sup> Low Energy Long Range mode
- S0 is configured through the [PCNF0.SOLEN](#) field
- LENGTH is configured through the [PCNF0.LFLEN](#) field
- S1 is configured through the [PCNF0.S1LEN](#) field
- Payload size is configured through the value in RAM corresponding to the LENGTH field
- Static add-on size is configured through the [PCNF1.STATLEN](#) field

The [PCNF1.MAXLEN](#) field configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by the RADIO. This feature can be used to ensure that the RADIO does not overwrite, or read beyond, the RAM assigned to the packet payload. This means that if the LENGTH field of the packet payload exceeds [PCNF1.STATLEN](#), and the LENGTH field in the packet specifies a packet larger than configured in [PCNF1.MAXLEN](#), the payload will be truncated to the length specified in [PCNF1.MAXLEN](#).

**Note:** The `PCNF1.MAXLEN` field includes the payload and the add-on, but excludes the size occupied by the `S0`, `LENGTH`, and `S1` fields. This has to be taken into account when allocating RAM.

If the payload and add-on length is specified larger than `PCNF1.MAXLEN`, the RADIO will still transmit or receive in the same way as before, except the payload is now truncated to `PCNF1.MAXLEN`. The packet's `LENGTH` field will not be altered when the payload is truncated. The RADIO will calculate CRC as if the packet length is equal to `PCNF1.MAXLEN`.

**Note:** If `PACKETPTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

The `END` event indicates that the last bit has been processed by the RADIO. The `DISABLED` event is issued to acknowledge that an `DISABLE` task is done.

## 6.18.15 Registers

| Base address | Peripheral | Instance | Description   | Configuration |
|--------------|------------|----------|---------------|---------------|
| 0x40001000   | RADIO      | RADIO    | 2.4 GHz radio |               |

Table 83: Instances

| Register                       | Offset | Description   |
|--------------------------------|--------|---|
| <code>TASKS_TXEN</code>        | 0x000  | Enable RADIO in TX mode   |
| <code>TASKS_RXEN</code>        | 0x004  | Enable RADIO in RX mode   |
| <code>TASKS_START</code>       | 0x008  | Start RADIO   |
| <code>TASKS_STOP</code>        | 0x00C  | Stop RADIO  |
| <code>TASKS_DISABLE</code>     | 0x010  | Disable RADIO   |
| <code>TASKS_RSSISTART</code>   | 0x014  | Start the RSSI and take one single sample of the receive signal strength  |
| <code>TASKS_RSSISTOP</code>    | 0x018  | Stop the RSSI measurement   |
| <code>TASKS_BCSTART</code>     | 0x01C  | Start the bit counter   |
| <code>TASKS_BCSTOP</code>      | 0x020  | Stop the bit counter  |
| <code>TASKS_EDSTART</code>     | 0x024  | Start the energy detect measurement used in IEEE 802.15.4 mode  |
| <code>TASKS_EDSTOP</code>      | 0x028  | Stop the energy detect measurement  |
| <code>TASKS_CCSTART</code>     | 0x02C  | Start the clear channel assessment used in IEEE 802.15.4 mode   |
| <code>TASKS_CCSTOP</code>      | 0x030  | Stop the clear channel assessment   |
| <code>EVENTS_READY</code>      | 0x100  | RADIO has ramped up and is ready to be started  |
| <code>EVENTS_ADDRESS</code>    | 0x104  | Address sent or received  |
| <code>EVENTS_PAYLOAD</code>    | 0x108  | Packet payload sent or received   |
| <code>EVENTS_END</code>        | 0x10C  | Packet sent or received   |
| <code>EVENTS_DISABLED</code>   | 0x110  | RADIO has been disabled   |
| <code>EVENTS_DEVMATCH</code>   | 0x114  | A device address match occurred on the last received packet   |
| <code>EVENTS_DEVMISS</code>    | 0x118  | No device address match occurred on the last received packet  |
| <code>EVENTS_RSSIEND</code>    | 0x11C  | Sampling of receive signal strength complete  |
| <code>EVENTS_BCMATCH</code>    | 0x128  | Bit counter reached bit count value   |
| <code>EVENTS_CRCOK</code>      | 0x130  | Packet received with CRC ok   |
| <code>EVENTS_CRCERROR</code>   | 0x134  | Packet received with CRC error  |
| <code>EVENTS_FRAMESTART</code> | 0x138  | IEEE 802.15.4 length field received   |
| <code>EVENTS_EDEND</code>      | 0x13C  | Sampling of energy detection complete. A new ED sample is ready for readout from the <code>RADIO.EDSAMPLE</code> register |
| <code>EVENTS_EDSTOPPED</code>  | 0x140  | The sampling of energy detection has stopped  |
| <code>EVENTS_CCAIDLE</code>    | 0x144  | Wireless medium in idle - clear to send   |
| <code>EVENTS_CCABUSY</code>    | 0x148  | Wireless medium busy - do not send  |

| Register          | Offset | Description  |
|-------------------|--------|--|
| EVENTS_CCASTOPPED | 0x14C  | The CCA has stopped  |
| EVENTS_RATEBOOST  | 0x150  | Ble_LR CI field received, receive mode is changed from Ble_LR125Kbit to Ble_LR500Kbit. |
| EVENTS_TXREADY    | 0x154  | RADIO has ramped up and is ready to be started TX path                                 |
| EVENTS_RXREADY    | 0x158  | RADIO has ramped up and is ready to be started RX path                                 |
| EVENTS_MHRMATCH   | 0x15C  | MAC header match found   |
| EVENTS_SYNC       | 0x168  | Preamble indicator   |
| EVENTS_PHYEND     | 0x16C  | Generated when last bit is sent on air, or received from air                           |
| EVENTS_CTEPRESENT | 0x170  | CTE is present (early warning right after receiving CTEInfo byte)                      |
| SHORTS            | 0x200  | Shortcuts between local events and tasks   |
| INTENSET          | 0x304  | Enable interrupt   |
| INTENCLR          | 0x308  | Disable interrupt  |
| CRCSTATUS         | 0x400  | CRC status   |
| RXMATCH           | 0x408  | Received address   |
| RXCRC             | 0x40C  | CRC field of previously received packet  |
| DAI               | 0x410  | Device address match index   |
| PDUSTAT           | 0x414  | Payload status   |
| CTESTATUS         | 0x44C  | CTEInfo parsed from received packet  |
| DFESTATUS         | 0x458  | DFE status information   |
| PACKETPTR         | 0x504  | Packet pointer   |
| FREQUENCY         | 0x508  | Frequency  |
| TXPOWER           | 0x50C  | Output power   |
| MODE              | 0x510  | Data rate and modulation   |
| PCNF0             | 0x514  | Packet configuration register 0  |
| PCNF1             | 0x518  | Packet configuration register 1  |
| BASE0             | 0x51C  | Base address 0   |
| BASE1             | 0x520  | Base address 1   |
| PREFIX0           | 0x524  | Prefixes bytes for logical addresses 0-3   |
| PREFIX1           | 0x528  | Prefixes bytes for logical addresses 4-7   |
| TXADDRESS         | 0x52C  | Transmit address select  |
| RXADDRESSES       | 0x530  | Receive address select   |
| CRC CNF           | 0x534  | CRC configuration  |
| CRC POLY          | 0x538  | CRC polynomial   |
| CRC INIT          | 0x53C  | CRC initial value  |
| TIFS              | 0x544  | Interframe spacing in $\mu$ s  |
| RSSISAMPLE        | 0x548  | RSSI sample  |
| STATE             | 0x550  | Current radio state  |
| DATAWHITEIV       | 0x554  | Data whitening initial value   |
| BCC               | 0x560  | Bit counter compare  |
| DAB[n]            | 0x600  | Device address base segment n  |
| DAP[n]            | 0x620  | Device address prefix n  |
| DACNF             | 0x640  | Device address match configuration   |
| MHRMATCHCONF      | 0x644  | Search pattern configuration   |
| MHRMATCHMAS       | 0x648  | Pattern mask   |
| MODECNF0          | 0x650  | Radio mode configuration register 0  |
| SFD               | 0x660  | IEEE 802.15.4 start of frame delimiter   |
| EDCNT             | 0x664  | IEEE 802.15.4 energy detect loop count   |
| EDSAMPLE          | 0x668  | IEEE 802.15.4 energy detect level  |
| CCACTRL           | 0x66C  | IEEE 802.15.4 clear channel assessment control   |
| DFEMODE           | 0x900  | Whether to use Angle-of-Arrival (AOA) or Angle-of-Departure (AOD)                      |
| CTEINLINECONF     | 0x904  | Configuration for CTE inline mode  |
| DFECTR1           | 0x910  | Various configuration for Direction finding  |
| DFECTR2           | 0x914  | Start offset for Direction finding   |
| SWITCHPATTERN     | 0x928  | GPIO patterns to be used for each antenna  |

| Register         | Offset | Description   |
|------------------|--------|---|
| CLEARPATTERN     | 0x92C  | Clear the GPIO pattern array for antenna control      |
| PSEL.DFEGPIO[0]  | 0x930  | Pin select for DFE pin 0                              |
| PSEL.DFEGPIO[1]  | 0x934  | Pin select for DFE pin 1                              |
| PSEL.DFEGPIO[2]  | 0x938  | Pin select for DFE pin 2                              |
| PSEL.DFEGPIO[3]  | 0x93C  | Pin select for DFE pin 3                              |
| PSEL.DFEGPIO[4]  | 0x940  | Pin select for DFE pin 4                              |
| PSEL.DFEGPIO[5]  | 0x944  | Pin select for DFE pin 5                              |
| PSEL.DFEGPIO[6]  | 0x948  | Pin select for DFE pin 6                              |
| PSEL.DFEGPIO[7]  | 0x94C  | Pin select for DFE pin 7                              |
| DFEPACKET.PTR    | 0x950  | Data pointer  |
| DFEPACKET.MAXCNT | 0x954  | Maximum number of buffer words to transfer            |
| DFEPACKET.AMOUNT | 0x958  | Number of samples transferred in the last transaction |
| POWER            | 0xFFC  | Peripheral power control                              |

| ID | Acce Field | Value ID | Value | Description  |
|----|------------|----------|-------|--|
| A  | RW         | CRCPOLY  |       | <p>CRC polynomial</p> <p>Each term in the CRC polynomial is mapped to a bit in this register which index corresponds to the term's exponent. The least significant term/bit is hardwired internally to 1, and bit number 0 of the register content is ignored by the hardware. The following example is for an 8 bit CRC polynomial: <math>x^8 + x^7 + x^3 + x^2 + 1 = 1\ 1000\ 1101</math>.</p> |

|----|------|------------|----------|----------|-------------|
| A  | R    | RSSISAMPLE |          | [0..127] | RSSI sample |

RSSI sample result. The value of this register is read as a positive value while the actual received signal strength is a negative value. Actual received signal strength is therefore as follows: received signal strength = -A dBm

### 6.18.15.82 SWITCHPATTERN

Address offset: 0x928

GPIO patterns to be used for each antenna

Maximum 8 GPIOs can be controlled. To secure correct signal levels on the pins, the pins must be configured in the GPIO peripheral as described in Pin configuration.

If, during switching, the total number of antenna slots is bigger than the number of written patterns, the RADIO loops back to the pattern used after the reference pattern.

A minimum number of 3 patterns must be written.

## 6.18.16 Electrical specification

### 6.18.16.1 General radio characteristics

| Symbol                    | Description                      | Min. | Typ. | Max. | Units       |
|---------------------------|----------------------------------|------|------|------|-------------|
| $f_{OP}$                  | Operating frequencies            | 2360 |      | 2500 | MHz         |
| $f_{PLL,CH,SP}$           | PLL channel spacing              |      | 1    |      | MHz         |
| $f_{DELTA,1M}$            | Frequency deviation @ 1 Mbps     |      | ±170 |      | kHz         |
| $f_{DELTA,BLE,1M}$        | Frequency deviation @ BLE 1 Mbps |      | ±250 |      | kHz         |
| $f_{DELTA,2M}$            | Frequency deviation @ 2 Mbps     |      | ±320 |      | kHz         |
| $f_{DELTA,BLE,2M}$        | Frequency deviation @ BLE 2 Mbps |      | ±500 |      | kHz         |
| $f_{skBPS}$               | On-the-air data rate             | 125  |      | 2000 | kbps        |
| $f_{chip, IEEE 802.15.4}$ | Chip rate in IEEE 802.15.4 mode  |      | 2000 |      | kchip,<br>s |

### 6.18.16.2 Radio current consumption (transmitter)

| Symbol                  | Description  | Min. | Typ. | Max. | Units |
|-------------------------|--|------|------|------|-------|
| $I_{TX,PLUS8dBm,DCDC}$  | TX only run current (DC/DC, 3 V) $P_{RF} = +8$ dBm |      | 14.2 |      | mA    |
| $I_{TX,PLUS8dBm}$       | TX only run current $P_{RF} = +8$ dBm              |      | 30.4 |      | mA    |
| $I_{TX,PLUS4dBm,DCDC}$  | TX only run current (DC/DC, 3 V) $P_{RF} = +4$ dBm |      | 9.6  |      | mA    |
| $I_{TX,PLUS4dBm}$       | TX only run current $P_{RF} = +4$ dBm              |      | 20.7 |      | mA    |
| $I_{TX,0dBm,DCDC}$      | TX only run current (DC/DC, 3 V) $P_{RF} = 0$ dBm  |      | 4.9  |      | mA    |
| $I_{TX,0dBm}$           | TX only run current $P_{RF} = 0$ dBm               |      | 10.3 |      | mA    |
| $I_{TX,MINUS4dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -4$ dBm   |      | 3.8  |      | mA    |
| $I_{TX,MINUS4dBm}$      | TX only run current $P_{RF} = -4$ dBm              |      | 8.0  |      | mA    |
| $I_{TX,MINUS8dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -8$ dBm   |      | 3.4  |      | mA    |
| $I_{TX,MINUS8dBm}$      | TX only run current $P_{RF} = -8$ dBm              |      | 7.1  |      | mA    |

| Symbol                   | Description                                       | Min. | Typ. | Max. | Units |
|--------------------------|---|------|------|------|-------|
| $I_{TX,MINUS12dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -12$ dBm |      | 3.1  |      | mA    |
| $I_{TX,MINUS12dBm}$      | TX only run current $P_{RF} = -12$ dBm            |      | 6.4  |      | mA    |
| $I_{TX,MINUS16dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -16$ dBm |      | 2.9  |      | mA    |
| $I_{TX,MINUS16dBm}$      | TX only run current $P_{RF} = -16$ dBm            |      | 5.9  |      | mA    |
| $I_{TX,MINUS20dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -20$ dBm |      | 2.7  |      | mA    |
| $I_{TX,MINUS20dBm}$      | TX only run current $P_{RF} = -20$ dBm            |      | 5.5  |      | mA    |
| $I_{TX,MINUS40dBm,DCDC}$ | TX only run current DC/DC, 3 V $P_{RF} = -40$ dBm |      | 2.3  |      | mA    |
| $I_{TX,MINUS40dBm}$      | TX only run current $P_{RF} = -40$ dBm            |      | 4.5  |      | mA    |
| $I_{START,TX,DCDC}$      | TX start-up current DC/DC, 3 V, $P_{RF} = 4$ dBm  |      | 4.3  |      | mA    |
| $I_{START,TX}$           | TX start-up current, $P_{RF} = 4$ dBm             |      | 8.9  |      | mA    |

### 6.18.16.3 Radio current consumption (Receiver)

| Symbol                 | Description  | Min. | Typ. | Max. | Units |
|------------------------|--|------|------|------|-------|
| $I_{RX,1M,DCDC}$       | RX only run current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE |      | 4.6  |      | mA    |
| $I_{RX,1M}$            | RX only run current (LDO, 3 V) 1 Mbps/1 Mbps BLE   |      | 9.6  |      | mA    |
| $I_{RX,2M,DCDC}$       | RX only run current (DC/DC, 3 V) 2 Mbps/2 Mbps BLE |      | 5.2  |      | mA    |
| $I_{RX,2M}$            | RX only run current (LDO, 3 V) 2 Mbps/2 Mbps BLE   |      | 10.7 |      | mA    |
| $I_{START,RX,1M,DCDC}$ | RX start-up current (DC/DC, 3 V) 1 Mbps/1 Mbps BLE |      | 3.4  |      | mA    |
| $I_{START,RX,1M}$      | RX start-up current 1 Mbps/1 Mbps BLE              |      | 6.8  |      | mA    |

### 6.18.16.4 Transmitter specification

| Symbol                       | Description  | Min. | Typ. | Max. | Units            |
|------------------------------|--|------|------|------|------------------|
| $P_{RF}$                     | Maximum output power                               |      | 8    |      | dBm              |
| $P_{RFC}$                    | RF power control range                             |      | 28   |      | dB               |
| $P_{RFCR}$                   | RF power accuracy                                  |      |      | ±4   | dB               |
| $P_{RF1,1}$                  | 1st Adjacent Channel Transmit Power 1 MHz (1 Mbps) |      | -25  |      | dBc              |
| $P_{RF2,1}$                  | 2nd Adjacent Channel Transmit Power 2 MHz (1 Mbps) |      | -54  |      | dBc              |
| $P_{RF1,2}$                  | 1st Adjacent Channel Transmit Power 2 MHz (2 Mbps) |      | -26  |      | dBc              |
| $P_{RF2,2}$                  | 2nd Adjacent Channel Transmit Power 4 MHz (2 Mbps) |      | -54  |      | dBc              |
| $E_{VM}$                     | Error vector magnitude IEEE 802.15.4               |      | 9    |      | % <sub>rms</sub> |
| $P_{harm2nd, IEEE 802.15.4}$ | 2nd harmonics in IEEE 802.15.4 mode                |      | -51  |      | dBm              |
| $P_{harm3rd, IEEE 802.15.4}$ | 3rd harmonics in IEEE 802.15.4                     |      | -51  |      | dBm              |

Figure 112: Output power, 1 Mbps Bluetooth low energy mode, at maximum TXPOWER setting (typical values)

Figure 113: Output power, 1 Mbps Bluetooth low energy mode, at 0 dBm TXPOWER setting (typical values)

## 6.18.16.5 Receiver operation

| Symbol                          | Description   | Min. | Typ. | Max. | Units |
|---------------------------------|---|------|------|------|-------|
| P <sub>RX,MAX</sub>             | Maximum received signal strength at < 0.1% PER  |      | 0    |      | dBm   |
| P <sub>SENS,IT,1M</sub>         | Sensitivity, 1 Mbps nRF mode ideal transmitter <sup>17</sup>                                |      | -93  |      | dBm   |
| P <sub>SENS,IT,2M</sub>         | Sensitivity, 2 Mbps nRF mode ideal transmitter <sup>18</sup>                                |      | -89  |      | dBm   |
| P <sub>SENS,IT,SP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≤ 37 bytes BER=1E-3 <sup>19</sup>  |      | -96  |      | dBm   |
| P <sub>SENS,IT,LP,1M,BLE</sub>  | Sensitivity, 1 Mbps BLE ideal transmitter, packet length ≥ 128 bytes BER=1E-4 <sup>20</sup> |      | -94  |      | dBm   |
| P <sub>SENS,IT,SP,2M,BLE</sub>  | Sensitivity, 2 Mbps BLE ideal transmitter, packet length ≤ 37 bytes                         |      | -92  |      | dBm   |
| P <sub>SENS,IT,BLE LE125k</sub> | Sensitivity, 125 kbps BLE mode  |      | -103 |      | dBm   |
| P <sub>SENS,IT,BLE LE500k</sub> | Sensitivity, 500 kbps BLE mode  |      | -98  |      | dBm   |
| P <sub>SENS,IEEE 802.15.4</sub> | Sensitivity in IEEE 802.15.4 mode   |      | -100 |      | dBm   |

Figure 114: Sensitivity, 1 Mbps Bluetooth low energy mode, Regulator = LDO (typical values)

## 6.18.16.6 RX selectivity

RX selectivity with equal modulation on interfering signal<sup>21</sup>

<sup>17</sup> Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1...7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

<sup>18</sup> Typical sensitivity applies when ADDR0 is used for receiver address correlation. When ADDR[1..7] are used for receiver address correlation, the typical sensitivity for this mode is degraded by 3 dB.

<sup>19</sup> As defined in the *Bluetooth Core Specification v4.0 Volume 6: Core System Package (Low Energy Controller Volume)*

<sup>20</sup> Equivalent BER limit < 10E-04

<sup>21</sup> Desired signal level at PIN = -67 dBm. One interferer is used, having equal modulation as the desired signal. The input power of the interferer where the sensitivity equals BER = 0.1% is presented

| Symbol                                | Description  | Min. | Typ. | Max. | Units |
|---------------------------------------|--|------|------|------|-------|
| C/l <sub>1M</sub> ,co-channel         | 1Mbps mode, Co-Channel interference                      |      | 10   |      | dB    |
| C/l <sub>1M</sub> ,-1MHz              | 1 Mbps mode, Adjacent (-1 MHz) interference              |      | -5   |      | dB    |
| C/l <sub>1M</sub> ,+1MHz              | 1 Mbps mode, Adjacent (+1 MHz) interference              |      | -14  |      | dB    |
| C/l <sub>1M</sub> ,-2MHz              | 1 Mbps mode, Adjacent (-2 MHz) interference              |      | -19  |      | dB    |
| C/l <sub>1M</sub> ,+2MHz              | 1 Mbps mode, Adjacent (+2 MHz) interference              |      | -42  |      | dB    |
| C/l <sub>1M</sub> ,-3MHz              | 1 Mbps mode, Adjacent (-3 MHz) interference              |      | -37  |      | dB    |
| C/l <sub>1M</sub> ,+3MHz              | 1 Mbps mode, Adjacent (+3 MHz) interference              |      | -47  |      | dB    |
| C/l <sub>1M</sub> ,≥6MHz              | 1 Mbps mode, Adjacent (≥6 MHz) interference              |      | -52  |      | dB    |
| C/l <sub>1MBLE</sub> ,co-channel      | 1 Mbps BLE mode, Co-Channel interference                 |      | 6    |      | dB    |
| C/l <sub>1MBLE</sub> ,-1MHz           | 1 Mbps BLE mode, Adjacent (-1 MHz) interference          |      | -2   |      | dB    |
| C/l <sub>1MBLE</sub> ,+1MHz           | 1 Mbps BLE mode, Adjacent (+1 MHz) interference          |      | -10  |      | dB    |
| C/l <sub>1MBLE</sub> ,-2MHz           | 1 Mbps BLE mode, Adjacent (-2 MHz) interference          |      | -23  |      | dB    |
| C/l <sub>1MBLE</sub> ,+2MHz           | 1 Mbps BLE mode, Adjacent (+2 MHz) interference          |      | -45  |      | dB    |
| C/l <sub>1MBLE</sub> ,>3MHz           | 1 Mbps BLE mode, Adjacent (≥3 MHz) interference          |      | -54  |      | dB    |
| C/l <sub>1MBLE</sub> ,image           | Image frequency interference                             |      | -24  |      | dB    |
| C/l <sub>1MBLE</sub> ,image,1MHz      | Adjacent (1 MHz) interference to in-band image frequency |      | -37  |      | dB    |
| C/l <sub>2M</sub> ,co-channel         | 2 Mbps mode, Co-Channel interference                     |      | 10   |      | dB    |
| C/l <sub>2M</sub> ,-2MHz              | 2 Mbps mode, Adjacent (-2 MHz) interference              |      | -4   |      | dB    |
| C/l <sub>2M</sub> ,+2MHz              | 2 Mbps mode, Adjacent (+2 MHz) interference              |      | -16  |      | dB    |
| C/l <sub>2M</sub> ,-4MHz              | 2 Mbps mode, Adjacent (-4 MHz) interference              |      | -19  |      | dB    |
| C/l <sub>2M</sub> ,+4MHz              | 2 Mbps mode, Adjacent (+4 MHz) interference              |      | -46  |      | dB    |
| C/l <sub>2M</sub> ,-6MHz              | 2 Mbps mode, Adjacent (-6 MHz) interference              |      | -41  |      | dB    |
| C/l <sub>2M</sub> ,+6MHz              | 2 Mbps mode, Adjacent (+6 MHz) interference              |      | -48  |      | dB    |
| C/l <sub>2M</sub> ,≥12MHz             | 2 Mbps mode, Adjacent (≥12 MHz) interference             |      | -52  |      | dB    |
| C/l <sub>2MBLE</sub> ,co-channel      | 2 Mbps BLE mode, Co-Channel interference                 |      | 7    |      | dB    |
| C/l <sub>2MBLE</sub> ,-2MHz           | 2 Mbps BLE mode, Adjacent (-2 MHz) interference          |      | -2   |      | dB    |
| C/l <sub>2MBLE</sub> ,+2MHz           | 2 Mbps BLE mode, Adjacent (+2 MHz) interference          |      | -12  |      | dB    |
| C/l <sub>2MBLE</sub> ,-4MHz           | 2 Mbps BLE mode, Adjacent (-4 MHz) interference          |      | -22  |      | dB    |
| C/l <sub>2MBLE</sub> ,+4MHz           | 2 Mbps BLE mode, Adjacent (+4 MHz) interference          |      | -46  |      | dB    |

| C/l <sub>IEEE 802.15.4</sub> ,±10MHz  | IEEE 802.15.4 mode, Alternate (±10 MHz) rejection        |      | -49  |      | dB    |

### 6.18.16.7 RX intermodulation

#### RX intermodulation<sup>22</sup>

<sup>22</sup> Desired signal level at PIN = -64 dBm. Two interferers with equal input power are used. The interferer closest in frequency is not modulated, the other interferer is modulated equal with the desired signal. The input power of the interferers where the sensitivity equals BER = 0.1% is presented.

| Symbol                      | Description   | Min. | Typ. | Max. | Units |
|-----------------------------|---|------|------|------|-------|
| P <sub>IMD,5TH,1M</sub>     | IMD performance, 1 Mbps, 5th offset channel, packet length ≤ 37 bytes     |      | -34  |      | dBm   |
| P <sub>IMD,5TH,1M,BLE</sub> | IMD performance, BLE 1 Mbps, 5th offset channel, packet length ≤ 37 bytes |      | -32  |      | dBm   |
| P <sub>IMD,5TH,2M</sub>     | IMD performance, 2 Mbps, 5th offset channel, packet length ≤ 37 bytes     |      | -33  |      | dBm   |
| P <sub>IMD,5TH,2M,BLE</sub> | IMD performance, BLE 2 Mbps, 5th offset channel, packet length ≤ 37 bytes |      | -32  |      | dBm   |

### 6.18.16.8 Radio timing

| Symbol                               | Description  | Min. | Typ. | Max. | Units |
|--------------------------------------|--|------|------|------|-------|
| t <sub>TXEN,BLE,1M</sub>             | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE and 150 μs TIFS)                   | 140  |      | 140  | μs    |
| t <sub>TXEN,FAST,BLE,1M</sub>        | Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up and 150 μs TIFS) | 40   |      | 40   | μs    |
| t <sub>TXDIS,BLE,1M</sub>            | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit                      | 6    |      | 6    | μs    |
| t <sub>RXEN,BLE,1M</sub>             | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE)                               | 140  |      | 140  | μs    |
| t <sub>RXEN,FAST,BLE,1M</sub>        | Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps BLE with fast ramp-up)             | 40   |      | 40   | μs    |
| t <sub>RXDIS,BLE,1M</sub>            | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit                      | 0    |      | 0    | μs    |
| t <sub>TXDIS,BLE,2M</sub>            | When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit                      | 4    |      | 4    | μs    |
| t <sub>RXDIS,BLE,2M</sub>            | When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit                      | 0    |      | 0    | μs    |
| t <sub>TXEN,IEEE 802.15.4</sub>      | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4)                                | 130  |      | 130  | μs    |
| t <sub>TXEN,FAST,IEEE 802.15.4</sub> | Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up)              | 40   |      | 40   | μs    |
| t <sub>TXDIS,IEEE 802.15.4</sub>     | When in TX, delay between DISABLE task and DISABLED event (IEEE 802.15.4)  | 21   |      | 21   | μs    |
| t <sub>RXEN,IEEE 802.15.4</sub>      | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4)                            | 130  |      | 130  | μs    |
| t <sub>RXEN,FAST,IEEE 802.15.4</sub> | Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 with fast ramp-up)          | 40   |      | 40   | μs    |
| t <sub>RXDIS,IEEE 802.15.4</sub>     | When in RX, delay between DISABLE task and DISABLED event (IEEE 802.15.4)  | 0.5  |      | 0.5  | μs    |
| t <sub>RX-to-TX turnaround</sub>     | Maximum TX-to-RX or RX-to-TX turnaround time in IEEE 802.15.4 mode   |      | 40   |      | μs    |

### 6.18.16.9 Received signal strength indicator (RSSI) specifications

| Symbol                     | Description                                  | Min. | Typ. | Max. | Units |
|----------------------------|--|------|------|------|-------|
| RSSI <sub>ACC</sub>        | RSSI accuracy <sup>23</sup>                  |      | ±2   |      | dB    |
| RSSI <sub>RESOLUTION</sub> | RSSI resolution                              |      | 1    |      | dB    |
| RSSI <sub>PERIOD</sub>     | RSSI sampling time from RSSI_START task      |      | 0.25 |      | µs    |
| RSSI <sub>SETTLE</sub>     | RSSI settling time after signal level change |      | 15   |      | µs    |

### 6.18.16.10 Jitter

| Symbol                      | Description   | Min. | Typ. | Max. | Units |
|-----------------------------|---|------|------|------|-------|
| t <sub>DISABLEDJITTER</sub> | Jitter on DISABLED event relative to END event when shortcut between END and DISABLE is enabled |      | 0.25 |      | µs    |
| t <sub>READYJITTER</sub>    | Jitter on READY event relative to TXEN and RXEN task  |      | 0.25 |      | µs    |

### 6.18.16.11 IEEE 802.15.4 energy detection constants

| Symbol       | Description   | Min. | Typ. | Max. | Units |
|--------------|---|------|------|------|-------|
| ED_RSSISCALE | Scaling value when converting between hardware-reported value and dBm |      | 5    |      |       |
| ED_RSSIOFFS  | Offset value when converting between hardware-reported value and dBm  |      | -93  |      |       |

## 6.19 RNG — Random number generator

The Random number generator (RNG) generates true non-deterministic random numbers based on internal thermal noise that are suitable for cryptographic purposes. The RNG does not require a seed value.

Figure 115: Random number generator

The RNG is started by triggering the START task and stopped by triggering the STOP task. When started, new random numbers are generated continuously and written to the VALUE register when ready. A VALRDY event is generated for every new random number that is written to the VALUE register. This means that after a VALRDY event is generated, the CPU has the time until the next VALRDY event to read out the random number from the VALUE register before it is overwritten by a new random number.

### 6.19.1 Bias correction

A bias correction algorithm is employed on the internal bit stream to remove any bias toward 1 or 0. The bits are then queued into an eight-bit register for parallel readout from the VALUE register.

It is possible to enable bias correction in the CONFIG register. This will result in slower value generation, but will ensure a statistically uniform distribution of the random values.

<sup>23</sup> Valid range -90 to -30 dBm

## 6.19.2 Speed

The time needed to generate one random byte of data is unpredictable, and may vary from one byte to the next. This is especially true when bias correction is enabled.

## 6.19.3 Registers

| Base address | Peripheral | Instance | Description             | Configuration |
|--------------|------------|----------|-------------------------|---------------|
| 0x4000D000   | RNG        | RNG      | Random number generator |               |

Table 85: Instances

| Register      | Offset | Description   |
|---------------|--------|---|
| TASKS_START   | 0x000  | Task starting the random number generator                                       |
| TASKS_STOP    | 0x004  | Task stopping the random number generator                                       |
| EVENTS_VALRDY | 0x100  | Event being generated for every new random number written to the VALUE register |
| SHORTS        | 0x200  | Shortcuts between local events and tasks  |
| INTENSET      | 0x304  | Enable interrupt  |
| INTENCLR      | 0x308  | Disable interrupt   |
| CONFIG        | 0x504  | Configuration register  |
| VALUE         | 0x508  | Output random number  |

Table 86: Register overview

### 6.19.3.1 TASKS\_START

Address offset: 0x000

Task starting the random number generator

| Bit number       | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |             |         |    |       |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |

## 6.19.4 Electrical specification

### 6.19.4.1 RNG Electrical Specification

| Symbol                 | Description  | Min. | Typ. | Max. | Units         |
|------------------------|--|------|------|------|---------------|
| $t_{\text{RNG,START}}$ | Time from setting the START task to generation begins.<br>This is a one-time delay on START signal and does not apply between samples. |      | 128  |      | $\mu\text{s}$ |
| $t_{\text{RNG,RAW}}$   | Run time per byte without bias correction. Uniform distribution of 0 and 1 is not guaranteed.  |      | 30   |      | $\mu\text{s}$ |
| $t_{\text{RNG,BC}}$    | Run time per byte with bias correction. Uniform distribution of 0 and 1 is guaranteed. Time to generate a byte cannot be guaranteed.   |      | 120  |      | $\mu\text{s}$ |

## 6.20 RTC — Real-time counter

The Real-time counter (RTC) module provides a generic, low power timer on the low-frequency clock source (LFCLK).

Figure 116: RTC block schematic

The RTC module features a 24-bit COUNTER, a 12-bit (1/X) prescaler, capture/compare registers, and a tick event generator for low power, tickless RTOS implementation.

### 6.20.1 Clock source

The RTC will run off the LFCLK.

The COUNTER resolution will therefore be 30.517  $\mu$ s. Depending on the source, the RTC is able to run while the HFCLK is OFF and PCLK16M is not available.

The software has to explicitly start LFCLK before using the RTC.

See [CLOCK — Clock control](#) on page 80 for more information about clock sources.

### 6.20.2 Resolution versus overflow and the PRESCALER

Counter increment frequency:

$$f_{\text{RTC}} [\text{kHz}] = 32.768 / (\text{PRESCALER} + 1)$$

The PRESCALER register is read/write when the RTC is stopped. The PRESCALER register is read-only once the RTC is STARTed. Writing to the PRESCALER register when the RTC is started has no effect.

The PRESCALER is restarted on START, CLEAR and TRIGOVRFW, that is, the prescaler value is latched to an internal register (<<PRESC>>) on these tasks.

Examples:

1. Desired COUNTER frequency 100 Hz (10 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 100 \text{ Hz}) - 1 = 327$$

$$f_{\text{RTC}} = 99.9 \text{ Hz}$$

$$10009.576 \mu\text{s counter period}$$

2. Desired COUNTER frequency 8 Hz (125 ms counter period)

$$\text{PRESCALER} = \text{round}(32.768 \text{ kHz} / 8 \text{ Hz}) - 1 = 4095$$

$$f_{\text{RTC}} = 8 \text{ Hz}$$

125 ms counter period

| Prescaler  | Counter resolution | Overflow       |
|------------|--------------------|----------------|
| 0          | 30.517 $\mu$ s     | 512 seconds    |
| $2^8-1$    | 7812.5 $\mu$ s     | 131072 seconds |
| $2^{12}-1$ | 125 ms             | 582.542 hours  |

Table 87: RTC resolution versus overflow

### 6.20.3 COUNTER register

The COUNTER increments on LFCLK when the internal PRESCALER register (<<PRESC>>) is 0x00. <<PRESC>> is reloaded from the PRESCALER register. If enabled, the TICK event occurs on each increment of the COUNTER. The TICK event is disabled by default.

Figure 117: Timing diagram - COUNTER\_PRESCALER\_0

Figure 118: Timing diagram - COUNTER\_PRESCALER\_1

### 6.20.4 Overflow features

The TRIGOVFLW task sets the COUNTER value to 0xFFFFF0 to allow SW test of the overflow condition.

OVRFLW occurs when COUNTER overflows from 0xFFFFF to 0.

**Important:** The OVRFLW event is disabled by default.

### 6.20.5 TICK event

The TICK event enables low power "tick-less" RTOS implementation as it optionally provides a regular interrupt source for a RTOS without the need to use the ARM<sup>®</sup> SysTick feature.

Using the RTC TICK event rather than the SysTick allows the CPU to be powered down while still keeping RTOS scheduling active.

**Important:** The TICK event is disabled by default.

## 6.20.6 Event control feature

To optimize RTC power consumption, events in the RTC can be individually disabled to prevent PCLK16M and HFCLK being requested when those events are triggered. This is managed using the EVTEN register.

For example, if the TICK event is not required for an application, this event should be disabled as it is frequently occurring and may increase power consumption if HFCLK otherwise could be powered down for long durations.

This means that the RTC implements a slightly different task and event system compared to the standard system described in [Peripheral interface](#) on page 96. The RTC task and event system is illustrated in [Tasks, events and interrupts in the RTC](#) on page 348.

Figure 119: Tasks, events and interrupts in the RTC

## 6.20.7 Compare feature

There are a number of Compare registers.

For more information, see [Registers](#) on page 353.

When setting a compare register, the following behavior of the RTC compare event should be noted:

- If a CC register value is 0 when a CLEAR task is set, this will not trigger a COMPARE event.

Figure 120: Timing diagram - COMPARE\_CLEAR

- If a CC register is N and the COUNTER value is N when the START task is set, this will not trigger a COMPARE event.

Figure 121: Timing diagram - COMPARE\_START

- COMPARE occurs when a CC register is N and the COUNTER value transitions from N-1 to N.

Figure 122: Timing diagram - COMPARE

- If the COUNTER is N, writing N+2 to a CC register is guaranteed to trigger a COMPARE event at N+2.

Figure 123: Timing diagram - COMPARE\_N+2

- If the COUNTER is N, writing N or N+1 to a CC register may not trigger a COMPARE event.

Figure 124: Timing diagram - COMPARE\_N+1

- If the COUNTER is N and the current CC register value is N+1 or N+2 when a new CC value is written, a match may trigger on the previous CC value before the new value takes effect. If the current CC value greater than N+2 when the new value is written, there will be no event due to the old value.

Figure 125: Timing diagram - COMPARE\_N-1

### 6.20.8 TASK and EVENT jitter/delay

Jitter or delay in the RTC is due to the peripheral clock being a low frequency clock (LFCLK) which is not synchronous to the faster PCLK16M.

Registers in the peripheral interface, part of the PCLK16M domain, have a set of mirrored registers in the LFCLK domain. For example, the COUNTER value accessible from the CPU is in the PCLK16M domain and is latched on read from an internal register called COUNTER in the LFCLK domain. COUNTER is the register which is actually modified each time the RTC ticks. These registers must be synchronised between clock domains (PCLK16M and LFCLK).

The following is a summary of the jitter introduced on tasks and events. Figures illustrating jitter follow.

| Task                            | Delay             |
|---------------------------------|-------------------|
| CLEAR, STOP, START, TRIGOVRFLOW | +15 to 46 $\mu$ s |

Table 88: RTC jitter magnitudes on tasks

| Operation/Function               | Jitter         |
|----------------------------------|----------------|
| START to COUNTER increment       | +/- 15 $\mu$ s |
| COMPARE to COMPARE <sup>24</sup> | +/- 62.5 ns    |

Table 89: RTC jitter magnitudes on events

1. CLEAR and STOP (and TRIGOVRFLOW; not shown) will be delayed as long as it takes for the peripheral to clock a falling edge and rising of the LFCLK. This is between 15.2585  $\mu$ s and 45.7755  $\mu$ s – rounded to 15  $\mu$ s and 46  $\mu$ s for the remainder of the section.

Figure 126: Timing diagram - DELAY\_CLEAR

Figure 127: Timing diagram - DELAY\_STOP

2. The START task will start the RTC. Assuming that the LFCLK was previously running and stable, the first increment of COUNTER (and instance of TICK event) will be typically after 30.5  $\mu$ s +/- 15  $\mu$ s. In some cases, in particular if the RTC is STARTed before the LFCLK is running, that timing can be up to ~250  $\mu$ s. The software should therefore wait for the first TICK if it has to make sure the RTC is running.

<sup>24</sup> Assumes RTC runs continuously between these events.

**Note:** 32.768 kHz clock jitter is additional to the numbers provided above.

Sending a TRIGOVFLW task sets the COUNTER to a value close to overflow. However, since the update of COUNTER relies on a stable LFCLK, sending this task while LFCLK is not running will start LFCLK, but the update will then be delayed by the same amount of time of up to ~250  $\mu$ s. The figures show the smallest and largest delays to on the START task which appears as a +/-15  $\mu$ s jitter on the first COUNTER increment.

Figure 128: Timing diagram - JITTER\_START-

Figure 129: Timing diagram - JITTER\_START+

### 6.20.9 Reading the COUNTER register

To read the COUNTER register, the internal <<COUNTER>> value is sampled.

To ensure that the <<COUNTER>> is safely sampled (considering an LFCLK transition may occur during a read), the CPU and core memory bus are halted for three cycles by lowering the core PREADY signal. The Read takes the CPU 2 cycles in addition resulting in the COUNTER register read taking a fixed five PCLK16M clock cycles.

Figure 130: Timing diagram - COUNTER\_READ

## 6.20.10 Registers

| Base address | Peripheral | Instance | Description         | Configuration                               |
|--------------|------------|----------|---------------------|---|
| 0x4000B000   | RTC        | RTC0     | Real-time counter 0 | CC[0..2] implemented, CC[3] not implemented |
| 0x40011000   | RTC        | RTC1     | Real-time counter 1 | CC[0..3] implemented                        |
| 0x40024000   | RTC        | RTC2     | Real-time counter 2 | CC[0..3] implemented                        |

Table 90: Instances

### 6.20.11 Electrical specification

## 6.21 SAADC — Successive approximation analog-to-digital converter

The SAADC is a differential successive approximation register (SAR) analog-to-digital converter. It supports up to eight external analog input channels, depending on package variant.

The following lists the main features of the SAADC:

- Multiple input channels
  - Each channel can use pins AIN0 through AIN7, the VDD pin, or the VDDH pin as input
  - Eight channels for single-ended inputs and four channels for differential inputs
- Full scale input range
- Individual reference selection for each channel
  - VDD
  - Internal reference
- Continuous sampling
- Output samples are automatically written to RAM using EasyDMA
- Samples are stored as 16-bit 2's complement values
- 8/10/12-bit resolution, 14-bit resolution with oversampling

Figure 131: Block diagram

An input channel is enabled and connected to an analog input pin using the registers [CH\[n\].PSELP](#) ( $n=0..7$ ) on page 375 and [CH\[n\].PSELN](#) ( $n=0..7$ ) on page 375.

Before any sampling can take place, the length and the location of the memory buffer in RAM where output values shall be written need to be configured, and the START task has to be triggered to apply the configuration. See [EasyDMA](#) on page 361 for details on memory configuration and how the results are placed in memory.

Sampling of all enabled channels is started by triggering the SAMPLE task, and the sample results are automatically written to memory using EasyDMA.

When multiple channels are enabled, they are sampled successively in a sequence starting with the lowest channel number. The time it takes to sample all enabled channels is given as follows:

$$\text{Total time} < \text{Sum}(\text{CH}[x].t_{\text{ACQ}} + t_{\text{CONV}}), \text{ } x \text{ is the number of enabled channels}$$

A DONE event is generated for every single completed conversion, and an END event is generated when multiple samples, as specified in [RESULT.MAXCNT](#) on page 378, have been written to memory.

## 6.21.1 Input configuration

Each SAADC channel can be configured to use either single-ended or differential input mode.

The configuration is done using the registers [CH\[n\].CONFIG](#) ( $n=0..7$ ) on page 376. In single-ended mode, the negative channel input is shorted to ground internally and the setting in the corresponding register [CH\[n\].PSELN](#) ( $n=0..7$ ) on page 375 will not apply. The assumption in single-ended mode is that the internal ground of the SAADC is the same as the external ground that the measured voltage is referred to. The SAADC is thus sensitive to ground bounce on the PCB in single-ended mode. If this is a concern, using differential measurement is recommended. In differential mode, both positive and negative input has to be configured in registers [CH\[n\].PSELP](#) ( $n=0..7$ ) on page 375 and [CH\[n\].PSELN](#) ( $n=0..7$ ) on page 375 respectively.

### 6.21.1.1 Acquisition time

To sample input voltage, the SAADC connects a capacitor to the input.

This is illustrated in the following figure:

Figure 132: Simplified SAADC sample network

The acquisition time indicates how long the capacitor is connected, see TACQ field in CH[n].CONFIG register. The required acquisition time depends on the source resistance ( $R_{source}$ ). For high source resistance the acquisition time should be increased:

| TACQ [ $\mu$ s] | Maximum source resistance [k $\Omega$ ] |
|-----------------|---|
| 3               | 10                                      |
| 5               | 40                                      |
| 10              | 100                                     |
| 15              | 200                                     |
| 20              | 400                                     |
| 40              | 800                                     |

Table 92: Acquisition time

When using VDDHDIV5 as input, the acquisition time needs to be 10  $\mu$ s or higher.

### 6.21.1.2 Internal resistor string (resistor ladder)

The SAADC has an internal resistor string for positive and negative input. The resistors are controlled in registers CH[n].CONFIG.RESP and CH[n].CONFIG.RESN.

The following figure illustrates the resistor ladder for positive (and negative) input:

Figure 133: Resistor ladder for positive input (negative input is equivalent, using RESN instead of RESP)

## 6.21.2 Reference voltage and gain settings

Each SAADC channel can have individual reference and gain settings.

This is configured in registers [CH\[n\].CONFIG \(n=0..7\)](#) on page 376. Available configuration options are:

- VDD/4 or internal 0.6 V reference
- Gain ranging from 1/6 to 4

The gain setting can be used to control the effective input range of the SAADC:

$$\text{Input range} = (\pm 0.6 \text{ V or } \pm \text{VDD}/4) / \text{gain}$$

For example, selecting VDD as reference, single-ended input (grounded negative input), and a gain of 1/4 will result in the following input range:

$$\text{Input range} = (\text{VDD}/4) / (1/4) = \text{VDD}$$

With internal reference, single-ended input (grounded negative input) and a gain of 1/6, the input range will be:

$$\text{Input range} = (0.6 \text{ V}) / (1/6) = 3.6 \text{ V}$$

Inputs AIN0 through AIN7 cannot exceed VDD or be lower than VSS.

## 6.21.3 Digital output

The digital output value from the SAADC is calculated using a formula.

$$\text{RESULT} = (V(P) - V(N)) * (\text{GAIN}/\text{REFERENCE}) * 2^{(\text{RESOLUTION} - m)}$$

where

**V(P)**

is the voltage at input P

**V(N)**

is the voltage at input N

**GAIN**

is the selected gain

**REFERENCE**

is the selected reference voltage

**RESOLUTION**

is output resolution in bits, as configured in register [RESOLUTION](#) on page 377

**m**

is 0 for single-ended channels

is 1 for differential channels

Results are sign extended to 16 bits and stored as little-endian byte order in RAM.

## 6.21.4 EasyDMA

The SAADC resources are started by triggering the START task. The SAADC is using EasyDMA to store results in a result buffer in RAM.

Registers [RESULT.PTR](#) on page 378 and [RESULT.MAXCNT](#) on page 378 must be configured before SAADC is started.

The result buffer is located at the address specified in register [RESULT.PTR](#) on page 378. This register is double-buffered, and it can be updated and prepared for the next START task immediately after the STARTED event is generated. The size of the result buffer is specified in register [RESULT.MAXCNT](#) on page 378, and the SAADC will generate an END event when it has filled up the result buffer, as illustrated in the following figure:

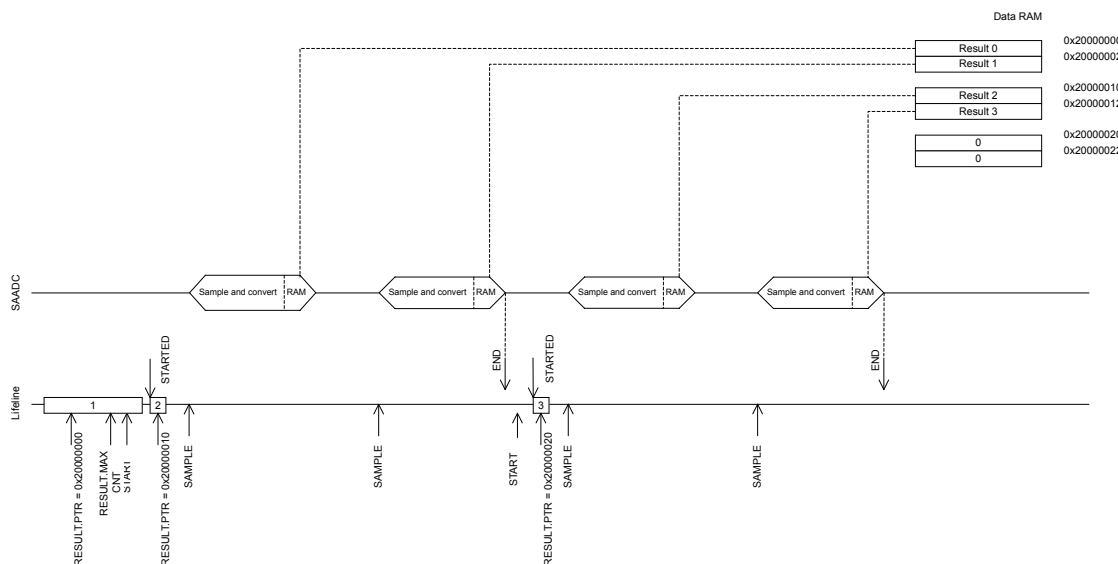

Figure 134: SAADC

The following figure shows how results are placed in RAM when multiple channels are enabled, and value in [RESULT.MAXCNT](#) on page 378 is an even number:

|                                  |                              |    |                              |   |
|----------------------------------|------------------------------|----|------------------------------|---|
|                                  | 31                           | 16 | 15                           | 0 |
| RESULT.PTR                       | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                   | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                   | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                  | (...)                        |    |                              |   |
| RESULT.PTR + 2*RESULT.MAXCNT - 4 | CH[5] last result            |    | CH[2] last result            |   |

Figure 135: Example of RAM placement: [RESULT.MAXCNT](#) even number, channels 1, 2 and 5 enabled

The following figure shows how results are placed in RAM when multiple channels are enabled and value in [RESULT.MAXCNT](#) on page 378 is an odd number:

|                                  |                              |    |                              |   |
|----------------------------------|------------------------------|----|------------------------------|---|
|                                  | 31                           | 16 | 15                           | 0 |
| RESULT.PTR                       | CH[2] 1 <sup>st</sup> result |    | CH[1] 1 <sup>st</sup> result |   |
| RESULT.PTR + 4                   | CH[1] 2 <sup>nd</sup> result |    | CH[5] 1 <sup>st</sup> result |   |
| RESULT.PTR + 8                   | CH[5] 2 <sup>nd</sup> result |    | CH[2] 2 <sup>nd</sup> result |   |
|                                  | (...)                        |    |                              |   |
| RESULT.PTR + 2*RESULT.MAXCNT - 2 |                              |    | CH[5] last result            |   |

Figure 136: Example of RAM placement: [RESULT.MAXCNT](#) odd number, channels 1, 2 and 5 enabled

The last 32-bit word is populated only with one 16-bit result. In both examples, channels 1, 2 and 5 are enabled, and all others are disabled.

See [Memory](#) on page 19 for more information about the different memory regions.

EasyDMA is finished with accessing RAM when events END or STOPPED are generated. The register [RESULT.AMOUNT](#) on page 379 can then be read, to see how many results have been transferred to the result buffer in RAM since the START task was triggered.

### 6.21.5 Continuous sampling

When using continuous sampling, new samples are automatically taken at a fixed sample rate.

Continuous sampling of both single and multiple channels can be implemented using a general purpose timer connecting a timer event to SAADC's SAMPLE task via PPI.

Alternatively, continuous sampling can be implemented by using the internal timer in the SAADC by setting the MODE field in register [SAMPLERATE](#) on page 378 to `Timers`. The sample rate (frequency at which the SAMPLE task is triggered) is configured in the same register. The internal timer and the continuous sampling are started by triggering the START task and stopped using the STOP task.

**Note:** Note that the internal timer can only be used when a single input channel is enabled.

For continuous sampling, ensure that the sample rate fullfills the following criteria:

$$f_{\text{SAMPLE}} < 1 / [\tau_{\text{ACQ}} + \tau_{\text{conv}}]$$

### 6.21.6 Oversampling

An accumulator in the SAADC can be used to find the average of several analog input samples. In general, oversampling improves the signal-to-noise ratio (SNR). Oversampling does not improve the integral non-linearity (INL) or differential non-linearity (DNL).

The accumulator is controlled in the [OVERSAMPLE](#) register. When using oversampling,  $2^{\text{OVERSAMPLE}}$  input samples are averaged before the sample result is transferred to memory. Hence, the SAMPLE task must be triggered  $2^{\text{OVERSAMPLE}}$  times for each output value. The following events are relevant:

- DONE event is generated for every input sample taken
- RESULTDONE event is generated for every averaged value ready to be transferred into RAM
- END event is generated when averaged values defined in [RESULT.MAXCNT](#) on page 378 have been written to memory. END event is generated every  $2^{\text{OVERSAMPLE}}$  time the DONE event is generated.

If value in [OVERSAMPLE](#) is set to 0, the DONE and RESULTDONE events will be generated at the same rate.

**Note:** Oversampling should only be used when a single input channel is enabled, as averaging is performed over all enabled channels.

### 6.21.7 Event monitoring using limits

A channel can be event monitored by using limits.

Limits are configured in [CH\[n\].LIMIT](#) register, with high limit and low limit.

**Note:** High limit shall always be higher than or equal to low limit.

Appropriate events are generated whenever the conversion results (sampled input signals) are outside of the two defined limits. It is not possible to generate an event when the input signal is inside a defined range by swapping high and low limits. An example of event monitoring using limits is illustrated in the following figure:

Figure 137: Example: Event monitoring on channel  $n$  using limits

The comparison to limits always takes place, it does not need to be specifically enabled. If comparison is not required on a channel, the software ignores the related events. In that situation, the value of the limits defined in register is irrelevant, i.e. it does not matter if the low limit is lower than the high limit or not.

### 6.21.8 Calibration

The SAADC has a temperature dependent offset.

Therefore, it is recommended to calibrate the SAADC at least once before use, and to re-run calibration every time the ambient temperature has changed by more than 10 °C.

Offset calibration is started by triggering the CALIBRATEOFFSET task, and the CALIBRATEDONE event is generated when calibration is done.

### 6.21.9 Registers

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40007000   | SAADC      | SAADC    | Analog to digital converter |               |

Table 93: Instances

| Register              | Offset | Description   |
|-----------------------|--------|---|
| TASKS_START           | 0x000  | Starts the SAADC and prepares the result buffer in RAM  |
| TASKS_SAMPLE          | 0x004  | Takes one SAADC sample  |
| TASKS_STOP            | 0x008  | Stops the SAADC and terminates all on-going conversions   |
| TASKS_CALIBRATEOFFSET | 0x00C  | Starts offset auto-calibration  |
| EVENTS_STARTED        | 0x100  | The SAADC has started   |
| EVENTS_END            | 0x104  | The SAADC has filled up the result buffer   |
| EVENTS_DONE           | 0x108  | A conversion task has been completed. Depending on the configuration, multiple conversions might be needed for a result to be transferred to RAM. |
| EVENTS_RESULTDONE     | 0x10C  | Result ready for transfer to RAM  |

| Register             | Offset | Description                                       |
|----------------------|--------|---|
| EVENTS_CALIBRATEDONE | 0x110  | Calibration is complete                           |
| EVENTS_STOPPED       | 0x114  | The SAADC has stopped                             |
| EVENTS_CH[0].LIMITH  | 0x118  | Last result is equal or above CH[0].LIMIT.HIGH    |
| EVENTS_CH[0].LIMITL  | 0x11C  | Last result is equal or below CH[0].LIMIT.LOW     |
| EVENTS_CH[1].LIMITH  | 0x120  | Last result is equal or above CH[1].LIMIT.HIGH    |
| EVENTS_CH[1].LIMITL  | 0x124  | Last result is equal or below CH[1].LIMIT.LOW     |
| EVENTS_CH[2].LIMITH  | 0x128  | Last result is equal or above CH[2].LIMIT.HIGH    |
| EVENTS_CH[2].LIMITL  | 0x12C  | Last result is equal or below CH[2].LIMIT.LOW     |
| EVENTS_CH[3].LIMITH  | 0x130  | Last result is equal or above CH[3].LIMIT.HIGH    |
| EVENTS_CH[3].LIMITL  | 0x134  | Last result is equal or below CH[3].LIMIT.LOW     |
| EVENTS_CH[4].LIMITH  | 0x138  | Last result is equal or above CH[4].LIMIT.HIGH    |
| EVENTS_CH[4].LIMITL  | 0x13C  | Last result is equal or below CH[4].LIMIT.LOW     |
| EVENTS_CH[5].LIMITH  | 0x140  | Last result is equal or above CH[5].LIMIT.HIGH    |
| EVENTS_CH[5].LIMITL  | 0x144  | Last result is equal or below CH[5].LIMIT.LOW     |
| EVENTS_CH[6].LIMITH  | 0x148  | Last result is equal or above CH[6].LIMIT.HIGH    |
| EVENTS_CH[6].LIMITL  | 0x14C  | Last result is equal or below CH[6].LIMIT.LOW     |
| EVENTS_CH[7].LIMITH  | 0x150  | Last result is equal or above CH[7].LIMIT.HIGH    |
| EVENTS_CH[7].LIMITL  | 0x154  | Last result is equal or below CH[7].LIMIT.LOW     |
| INTEN                | 0x300  | Enable or disable interrupt                       |
| INTENSET             | 0x304  | Enable interrupt                                  |
| INTENCLR             | 0x308  | Disable interrupt                                 |
| STATUS               | 0x400  | Status  |
| ENABLE               | 0x500  | Enable or disable SAADC                           |
| CH[0].PSELPL         | 0x510  | Input positive pin selection for CH[0]            |
| CH[0].PSELNL         | 0x514  | Input negative pin selection for CH[0]            |
| CH[0].CONFIG         | 0x518  | Input configuration for CH[0]                     |
| CH[0].LIMIT          | 0x51C  | High/low limits for event monitoring of a channel |
| CH[1].PSELPL         | 0x520  | Input positive pin selection for CH[1]            |
| CH[1].PSELNL         | 0x524  | Input negative pin selection for CH[1]            |
| CH[1].CONFIG         | 0x528  | Input configuration for CH[1]                     |
| CH[1].LIMIT          | 0x52C  | High/low limits for event monitoring of a channel |
| CH[2].PSELPL         | 0x530  | Input positive pin selection for CH[2]            |
| CH[2].PSELNL         | 0x534  | Input negative pin selection for CH[2]            |
| CH[2].CONFIG         | 0x538  | Input configuration for CH[2]                     |
| CH[2].LIMIT          | 0x53C  | High/low limits for event monitoring of a channel |
| CH[3].PSELPL         | 0x540  | Input positive pin selection for CH[3]            |
| CH[3].PSELNL         | 0x544  | Input negative pin selection for CH[3]            |
| CH[3].CONFIG         | 0x548  | Input configuration for CH[3]                     |
| CH[3].LIMIT          | 0x54C  | High/low limits for event monitoring of a channel |
| CH[4].PSELPL         | 0x550  | Input positive pin selection for CH[4]            |
| CH[4].PSELNL         | 0x554  | Input negative pin selection for CH[4]            |
| CH[4].CONFIG         | 0x558  | Input configuration for CH[4]                     |
| CH[4].LIMIT          | 0x55C  | High/low limits for event monitoring of a channel |
| CH[5].PSELPL         | 0x560  | Input positive pin selection for CH[5]            |
| CH[5].PSELNL         | 0x564  | Input negative pin selection for CH[5]            |
| CH[5].CONFIG         | 0x568  | Input configuration for CH[5]                     |
| CH[5].LIMIT          | 0x56C  | High/low limits for event monitoring of a channel |
| CH[6].PSELPL         | 0x570  | Input positive pin selection for CH[6]            |
| CH[6].PSELNL         | 0x574  | Input negative pin selection for CH[6]            |
| CH[6].CONFIG         | 0x578  | Input configuration for CH[6]                     |
| CH[6].LIMIT          | 0x57C  | High/low limits for event monitoring of a channel |
| CH[7].PSELPL         | 0x580  | Input positive pin selection for CH[7]            |
| CH[7].PSELNL         | 0x584  | Input negative pin selection for CH[7]            |

| Register      | Offset | Description  |
|---------------|--------|--|
| CH[7].CONFIG  | 0x588  | Input configuration for CH[7]  |
| CH[7].LIMIT   | 0x58C  | High/low limits for event monitoring of a channel  |
| RESOLUTION    | 0x5F0  | Resolution configuration   |
| OVERSAMPLE    | 0x5F4  | Oversampling configuration. The RESOLUTION is applied before averaging, thus for high OVERSAMPLE a higher RESOLUTION should be used. |
| SAMPLERATE    | 0x5F8  | Controls normal or continuous sample rate  |
| RESULT.PTR    | 0x62C  | Data pointer   |
| RESULT.MAXCNT | 0x630  | Maximum number of 16-bit samples to be written to output RAM buffer  |
| RESULT.AMOUNT | 0x634  | Number of 16-bit samples written to output RAM buffer since the previous START task  |

Table 94: Register overview

### 6.21.9.1 TASKS\_START

Address offset: 0x000

Starts the SAADC and prepares the result buffer in RAM

| Bit number       | 31  | 30       | 29    | 28   | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|----------|-------|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID               |   |          |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |          |       |  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce Field  | Value ID | Value | Description  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| A                | W TASKS_START   |          |       | Starts the SAADC and prepares the result buffer in RAM |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|                  |   | Trigger  | 1     | Trigger task   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 6.21.9.2 TASKS\_SAMPLE

Address offset: 0x004

Takes one SAADC sample

| Bit number       | 31  | 30       | 29    | 28                     | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|----------|-------|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID               |   |          |       |                        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |          |       |                        |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce Field  | Value ID | Value | Description            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| A                | W TASKS_SAMPLE  |          |       | Takes one SAADC sample |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|                  |   | Trigger  | 1     | Trigger task           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 6.21.9.3 TASKS\_STOP

Address offset: 0x008

Stops the SAADC and terminates all on-going conversions

| Bit number       | 31  | 30       | 29    | 28  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|---|----------|-------|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID               |   |          |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   | A |
| Reset 0x00000000 | 0 |          |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| ID               | Acce Field  | Value ID | Value | Description   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| A                | W TASKS_STOP  |          |       | Stops the SAADC and terminates all on-going conversions |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 6.22 SPI — Serial peripheral interface master

The SPI master provides a simple CPU interface which includes a TXD register for sending data and an RXD register for receiving data. This section is added for legacy support for now.

Figure 138: SPI master

RXD-1 and TXD+1 illustrate the double buffered version of RXD and TXD respectively.

### 6.22.1 Functional description

The TXD and RXD registers are double-buffered to enable some degree of uninterrupted data flow in and out of the SPI master.

The SPI master does not implement support for chip select directly. Therefore, the CPU must use available GPIOs to select the correct slave and control this independently of the SPI master. The SPI master supports SPI modes 0 through 3.

| Mode      | Clock polarity | Clock phase     |
|-----------|----------------|-----------------|
|           | CPOL           | CPHA            |
| SPI_MODE0 | 0 (Leading)    | 0 (Active high) |
| SPI_MODE1 | 0 (Leading)    | 1 (Active low)  |
| SPI_MODE2 | 1 (Trailing)   | 0 (Active high) |
| SPI_MODE3 | 1 (Trailing)   | 1 (Active low)  |

Table 95: SPI modes

### 6.22.1.1 SPI master mode pin configuration

The different signals SCK, MOSI, and MISO associated with the SPI master are mapped to physical pins.

This mapping is according to the configuration specified in the PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated SPI master signal is not connected to any physical pin. The PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI master is disabled.

To secure correct behavior in the SPI, the pins used by the SPI must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 381 prior to enabling the SPI. The SCK must always be connected to a pin, and that pin's input buffer must always be connected for the SPI to work. This configuration must be retained in the GPIO for the selected IOs as long as the SPI is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin            | Direction | Output value        |
|-------------------|---------------------------|-----------|---------------------|
| SCK               | As specified in PSEL.SCK  | Output    | Same as CONFIG.CPOL |
| MOSI              | As specified in PSEL.MOSI | Output    | 0                   |
| MISO              | As specified in PSEL.MISO | Input     | Not applicable      |

Table 96: GPIO configuration

### 6.22.1.2 Shared resources

The SPI shares registers and other resources with other peripherals that have the same ID as the SPI. Therefore, the user must disable all peripherals that have the same ID as the SPI before the SPI can be configured and used.

Disabling a peripheral that has the same ID as the SPI will not reset any of the registers that are shared with the SPI. It is therefore important to configure all relevant SPI registers explicitly to secure that it operates correctly.

See the Instantiation table in [Instantiation](#) on page 22 for details on peripherals and their IDs.

### 6.22.1.3 SPI master transaction sequence

An SPI master transaction is started by writing the first byte, which is to be transmitted by the SPI master, to the TXD register.

Since the transmitter is double buffered, the second byte can be written to the TXD register immediately after the first one. The SPI master will then send these bytes in the order they are written to the TXD register.

The SPI master is a synchronous interface, and for every byte that is sent, a different byte will be received at the same time; this is illustrated in [SPI master transaction](#) on page 382. Bytes that are received will be moved to the RXD register where the CPU can extract them by reading the register. The RXD register is double buffered in the same way as the TXD register, and a second byte can therefore be received at the

same time as the first byte is being extracted from RXD by the CPU. The SPI master will generate a READY event every time a new byte is moved to the RXD register. The double buffered byte will be moved from RXD-1 to RXD as soon as the first byte is extracted from RXD. The SPI master will stop when there are no more bytes to send in TXD and TXD+1.

Figure 139: SPI master transaction

The READY event of the third byte transaction is delayed until B is extracted from RXD in occurrence number 3 on the horizontal lifeline. The reason for this is that the third event is generated first when C is moved from RXD-1 to RXD after B is read.

The SPI master will move the incoming byte to the RXD register after a short delay following the SCK clock period of the last bit in the byte. This also means that the READY event will be delayed accordingly, see [SPI master transaction](#) on page 383. Therefore, it is important that you always clear the READY event, even if the RXD register and the data that is being received is not used.

Figure 140: SPI master transaction

## 6.22.2 Registers

| Base address | Peripheral | Instance | Description  | Configuration |
|--------------|------------|----------|--------------|---------------|
| 0x40003000   | SPI        | SPI0     | SPI master 0 | Deprecated    |
| 0x40004000   | SPI        | SPI1     | SPI master 1 | Deprecated    |
| 0x40023000   | SPI        | SPI2     | SPI master 2 | Deprecated    |

Table 97: Instances

| Register     | Offset | Description   |
|--------------|--------|---|
| EVENTS_READY | 0x108  | TXD byte sent and RXD byte received                           |
| INTENSET     | 0x304  | Enable interrupt  |
| INTENCLR     | 0x308  | Disable interrupt   |
| ENABLE       | 0x500  | Enable SPI  |
| PSEL.SCK     | 0x508  | Pin select for SCK  |
| PSEL.MOSI    | 0x50C  | Pin select for MOSI signal                                    |
| PSEL.MISO    | 0x510  | Pin select for MISO signal                                    |
| RXD          | 0x518  | RXD register  |
| TXD          | 0x51C  | TXD register  |
| FREQUENCY    | 0x524  | SPI frequency. Accuracy depends on the HFCLK source selected. |
| CONFIG       | 0x554  | Configuration register  |

## 6.22.3 Electrical specification

### 6.22.3.1 SPI master interface electrical specifications

| Symbol          | Description  | Min. | Typ. | Max.     | Units   |
|-----------------|--|------|------|----------|---------|
| $f_{SPI}$       | Bit rates for SPI <sup>28</sup>                        |      |      | $8^{29}$ | Mbps    |
| $t_{SPI,START}$ | Time from writing TXD register to transmission started |      | 1    |          | $\mu s$ |

### 6.22.3.2 Serial Peripheral Interface (SPI) Master timing specifications

| Symbol            | Description                                | Min.           | Typ. | Max.           | Units |
|-------------------|--|----------------|------|----------------|-------|
| $t_{SPI,CCLK}$    | SCK period                                 | 125            |      |                | ns    |
| $t_{SPI,RSCK,LD}$ | SCK rise time, standard drive <sup>a</sup> |                |      | $t_{RF,25pF}$  |       |
| $t_{SPI,RSCK,HD}$ | SCK rise time, high drive <sup>a</sup>     |                |      | $t_{HRF,25pF}$ |       |
| $t_{SPI,FSCK,LD}$ | SCK fall time, standard drive <sup>a</sup> |                |      | $t_{RF,25pF}$  |       |
| $t_{SPI,FSCK,HD}$ | SCK fall time, high drive <sup>a</sup>     |                |      | $t_{HRF,25pF}$ |       |
| $t_{SPI,WHSCCK}$  | SCK high time <sup>a</sup>                 | $(t_{CCLK}/2)$ |      |                |       |
|                   |  |                |      | $-t_{RSCK}$    |       |
| $t_{SPI,WLSCCK}$  | SCK low time <sup>a</sup>                  | $(t_{CCLK}/2)$ |      |                |       |
|                   |  |                |      | $-t_{FSCK}$    |       |
| $t_{SPI,SUMI}$    | MISO to CLK edge setup time                | 19             |      |                | ns    |
| $t_{SPI,HMI}$     | CLK edge to MISO hold time                 | 18             |      |                | ns    |
| $t_{SPI,VMO}$     | CLK edge to MOSI valid                     |                |      | 59             | ns    |
| $t_{SPI,HMO}$     | MOSI hold time after CLK edge              | 20             |      |                | ns    |

<sup>28</sup> High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>29</sup> The actual maximum data rate depends on the slave's CLK to MISO and MOSI setup and hold timings.

<sup>a</sup> At 25pF load, including GPIO capacitance, see GPIO spec.

Figure 141: SPI master timing diagram

## 6.23 SPIM — Serial peripheral interface master with EasyDMA

The SPI master can communicate with multiple SPI slaves using individual chip select signals for each slave.

Listed here are the main features for the SPIM

- EasyDMA direct transfer to/from RAM
- SPI mode 0-3
- Individual selection of I/O pins
- Optional D/CX output line for distinguishing between command and data bytes

Figure 142: SPIM — SPI master with EasyDMA

### 6.23.1 SPI master transaction sequence

An SPI master transaction is started by triggering the START task. When started, a number of bytes will be transmitted/received on MOSI/MISO.

The following figure illustrates an SPI master transaction:

Figure 143: SPI master transaction

The ENDTX is generated when all bytes in buffer `TXD.PTR` on page 401 are transmitted. The number of bytes in the transmit buffer is specified in register `TXD.MAXCNT` on page 401. The ENDRX event will be generated when buffer `RXD.PTR` on page 400 is full, that is when the number of bytes specified in register `RXD.MAXCNT` on page 400 have been received. The transaction stops automatically after all bytes have been transmitted/received. When the maximum number of bytes in receive buffer is larger than the number of bytes in the transmit buffer, the contents of register `ORC` on page 404 will be transmitted after the last byte in the transmit buffer has been transmitted.

The END event will be generated after both the ENDRX and ENDTX events have been generated.

The SPI master can be stopped in the middle of a transaction by triggering the STOP task. When triggering the STOP task the SPIM will complete the transmission/reception of the current byte before stopping. A STOPPED event is generated when the SPI master has stopped.

If the ENDTX event has not already been generated when the SPI master has come to a stop, the ENDTX event will be generated even if all bytes in the buffer `TXD.PTR` on page 401 have not been transmitted.

If the ENDRX event has not already been generated when the SPI master has come to a stop, the ENDRX event will be generated even if the buffer `RXD.PTR` on page 400 is not full.

A transaction can be suspended and resumed using the SUSPEND and RESUME tasks, respectively. When the SUSPEND task is triggered the SPI master will complete transmitting and receiving the current ongoing byte before it is suspended.

### 6.23.2 D/CX functionality

Some SPI slaves, for example display drivers, require an additional signal from the SPI master to distinguish between command and data bytes. For display drivers this line is often called D/CX.

The SPIM provides support for such a D/CX output line. The D/CX line is set low during transmission of command bytes and high during transmission of data bytes.

The D/CX pin number is selected using `PSELDCX` on page 403 and the number of command bytes preceding the data bytes is configured using `DCXCNT` on page 403.

It is not allowed to write to the `DCXCNT` on page 403 during an ongoing transmission.

Figure 144: D/CX example. SPIM.DCXCNT = 1.

### 6.23.3 Pin configuration

The SCK, CSN, DCX, MOSI, and MISO signals associated with the SPIM are mapped to physical pins according to the configuration specified in the PSEL.n registers.

The contents of registers [PSEL.SCK](#) on page 398, [PSEL.CSN](#) on page 399, [PSELDCX](#) on page 403, [PSEL.MOSI](#) on page 399 and [PSEL.MISO](#) on page 399 are only used when the SPIM is enabled and retained only as long as the device is in System ON mode. The PSEL.n registers can only be configured when the SPIM is disabled. Enabling/disabling is done using register [ENABLE](#) on page 398.

To ensure correct behavior, the pins used by the SPIM must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 391 before the SPIM is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI master signal | SPI master pin  | Direction | Output value        | Comments |
|-------------------|---|-----------|---------------------|----------|
| SCK               | As specified in <a href="#">PSEL.SCK</a> on page 398  | Output    | Same as CONFIG.CPOL |          |
| CSN               | As specified in <a href="#">PSEL.CSN</a> on page 399  | Output    | Same as CONFIG.CPOL |          |
| DCX               | As specified in <a href="#">PSELDCX</a> on page 403   | Output    | 1                   |          |
| MOSI              | As specified in <a href="#">PSEL.MOSI</a> on page 399 | Output    | 0                   |          |
| MISO              | As specified in <a href="#">PSEL.MISO</a> on page 399 | Input     | Not applicable      |          |

Table 99: GPIO configuration

Some SPIM instances do not support automatic control of CSN, and for those the available GPIO pins need to be used to control CSN directly. See [Instances](#) on page 393 for information about what features are supported in the various SPIM instances.

The SPIM supports SPI modes 0 through 3. The clock polarity (CPOL) and the clock phase (CPHA) are configured in register [CONFIG](#) on page 402.

| Mode      | Clock polarity  | Clock phase  |
|-----------|-----------------|--------------|
|           | CPOL            | CPHA         |
| SPI_MODE0 | 0 (Active High) | 0 (Leading)  |
| SPI_MODE1 | 0 (Active High) | 1 (Trailing) |
| SPI_MODE2 | 1 (Active Low)  | 0 (Leading)  |
| SPI_MODE3 | 1 (Active Low)  | 1 (Trailing) |

Table 100: SPI modes

### 6.23.4 EasyDMA

The SPIM implements EasyDMA for accessing RAM without CPU involvement.

The SPIM peripheral implements the following EasyDMA channels:

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 101: SPIM EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next transmission immediately after having received the STARTED event.

The SPI master will automatically stop transmitting after TXD.MAXCNT bytes have been transmitted and RXD.MAXCNT bytes have been received. If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register. If TXD.MAXCNT is larger than RXD.MAXCNT, the superfluous received bytes will be discarded.

The ENDRX/ENDTX event indicate that EasyDMA has finished accessing respectively the RX/TX buffer in RAM. The END event gets generated when both RX and TX are finished accessing the buffers in RAM.

In the case of bus congestion as described in [AHB multilayer](#) on page 46, the behaviour of the EasyDMA channel will depend on the SPIM instance. Refer to [Instances](#) on page 393 for information about what behaviour is supported in the various instances.

### 6.23.5 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

## 6.23.6 Registers

| Base address | Peripheral | Instance | Description  | Configuration  |
|--------------|------------|----------|--------------|--|
| 0x40003000   | SPIM       | SPIM0    | SPI master 0 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x40004000   | SPIM       | SPIM1    | SPI master 1 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x40023000   | SPIM       | SPIM2    | SPI master 2 | Not supported: > 8 Mbps data rate, CSNPOL register, DCX functionality, IFTIMING.x registers, hardware CSN control (PSEL.CSN), stalling mechanism during AHB bus contention. Recommended GPIOs for SCK signal for 8 Mbps data rate, see Pin assignments section for your package. |
| 0x4002F000   | SPIM       | SPIM3    | SPI master 3 |  |

Table 102: Instances

| Register       | Offset | Description  |
|----------------|--------|--|
| TASKS_START    | 0x010  | Start SPI transaction  |
| TASKS_STOP     | 0x014  | Stop SPI transaction   |
| TASKS_SUSPEND  | 0x01C  | Suspend SPI transaction  |
| TASKS_RESUME   | 0x020  | Resume SPI transaction   |
| EVENTS_STOPPED | 0x104  | SPI transaction has stopped  |
| EVENTS_ENDRX   | 0x110  | End of RXD buffer reached  |
| EVENTS_END     | 0x118  | End of RXD buffer and TXD buffer reached   |
| EVENTS_ENDTX   | 0x120  | End of TXD buffer reached  |
| EVENTS_STARTED | 0x14C  | Transaction started  |
| SHORTS         | 0x200  | Shortcuts between local events and tasks   |
| INTENSET       | 0x304  | Enable interrupt   |
| INTENCLR       | 0x308  | Disable interrupt  |
| STALLSTAT      | 0x400  | Stall status for EasyDMA RAM accesses. The fields in this register is set to STALL by hardware whenever a stall occurs and can be cleared (set to NOSTALL) by the CPU. |
| ENABLE         | 0x500  | Enable SPIM  |
| PSEL_SCK       | 0x508  | Pin select for SCK   |
| PSEL_MOSI      | 0x50C  | Pin select for MOSI signal   |
| PSEL_MISO      | 0x510  | Pin select for MISO signal   |
| PSEL_CSN       | 0x514  | Pin select for CSN   |
| FREQUENCY      | 0x524  | SPI frequency. Accuracy depends on the HFCLK source selected.  |
| RXD_PTR        | 0x534  | Data pointer   |

| Register         | Offset | Description  |
|------------------|--------|--|
| RXD.MAXCNT       | 0x538  | Maximum number of bytes in receive buffer  |
| RXD.AMOUNT       | 0x53C  | Number of bytes transferred in the last transaction  |
| RXD.LIST         | 0x540  | EasyDMA list type  |
| TXD.PTR          | 0x544  | Data pointer   |
| TXD.MAXCNT       | 0x548  | Number of bytes in transmit buffer   |
| TXD.AMOUNT       | 0x54C  | Number of bytes transferred in the last transaction  |
| TXD.LIST         | 0x550  | EasyDMA list type  |
| CONFIG           | 0x554  | Configuration register   |
| IFTIMING.RXDELAY | 0x560  | Sample delay for input serial data on MISO   |
| IFTIMING.CSNDUR  | 0x564  | Minimum duration between edge of CSN and edge of SCK and minimum duration CSN must stay high between transactions    |
| CSNPOL           | 0x568  | Polarity of CSN output   |
| PSELDCX          | 0x56C  | Pin select for DCX signal  |
| DCXCNT           | 0x570  | DCX configuration  |
| ORC              | 0x5C0  | Byte transmitted after TXD.MAXCNT bytes have been transmitted in the case when RXD.MAXCNT is greater than TXD.MAXCNT |

### 6.23.6.13 STALLSTAT

Address offset: 0x400

Stall status for EasyDMA RAM accesses. The fields in this register is set to STALL by hardware whenever a stall occurs and can be cleared (set to NOSTALL) by the CPU.

| A                       | RW RXDELAY  |          | [7..0] | Sample delay for input serial data on MISO. The value specifies the number of 64 MHz clock cycles (15.625 ns) delay from the the sampling edge of SCK (leading edge for CONFIG.CPHA = 0, trailing edge for CONFIG.CPHA = 1) until the input serial data is sampled. As an example, if RXDELAY = 0 and CONFIG.CPHA = 0, the input serial data is sampled on the rising edge of SCK. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |   |

### 6.23.6.30 IFTIMING.CSNDUR

Address offset: 0x564

Minimum duration between edge of CSN and edge of SCK and minimum duration CSN must stay high between transactions

| $t_{\text{SPIM,VMO}}$     | CLK edge to MOSI valid, SCK frequency $\leq$ 8 MHz |  |      | 59                           | ns            |
| $t_{\text{SPIM,VMO,HS}}$  | CLK edge to MOSI valid, SCK frequency $>$ 8 MHz    |  |      | 8                            | ns            |
| $t_{\text{SPIM,HMO}}$     | MOSI hold time after CLK edge                      | 20   |      |                              | ns            |

<sup>30</sup> High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>31</sup> At 25pF load, including GPIO pin capacitance, see GPIO spec.

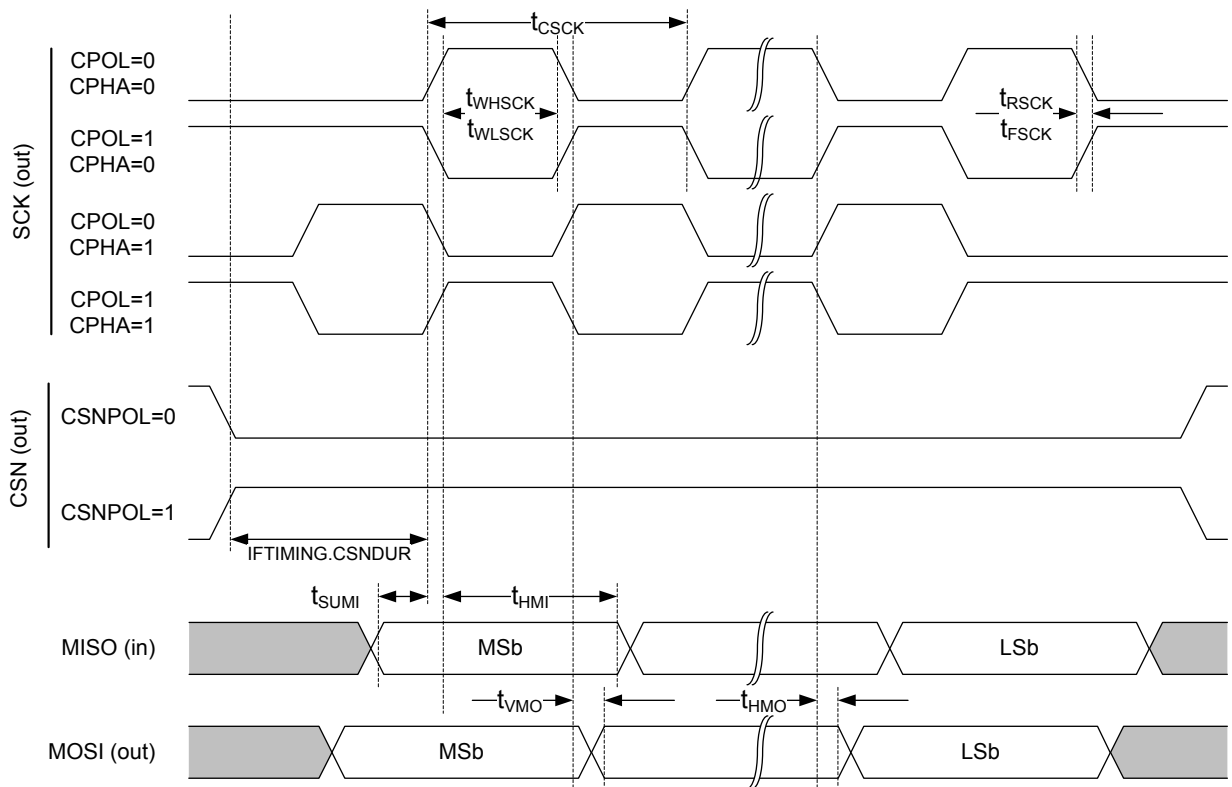

Figure 145: SPIM timing diagram

## 6.24 SPIS — Serial peripheral interface slave with EasyDMA

SPI slave (SPIS) is implemented with EasyDMA support for ultra low power serial communication from an external SPI master. EasyDMA in conjunction with hardware-based semaphore mechanisms removes all real-time requirements associated with controlling the SPI slave from a low priority CPU execution context.

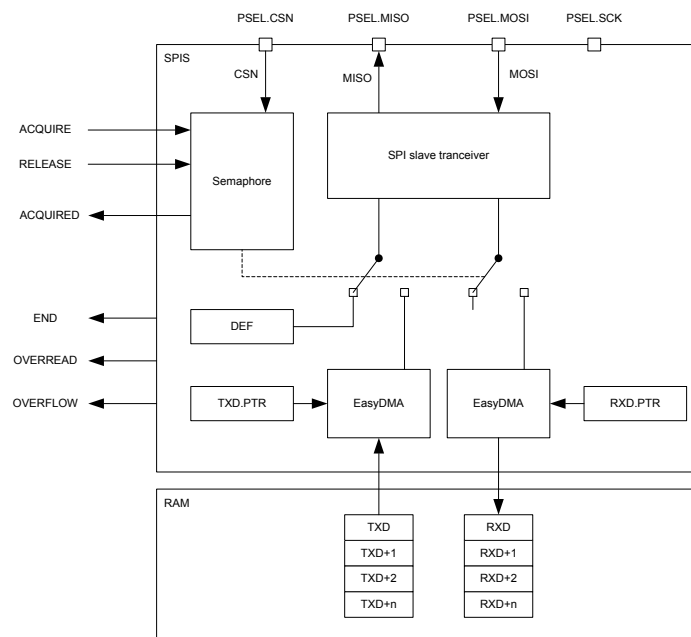

Figure 146: SPI slave

The SPIS supports SPI modes 0 through 3. The CONFIG register allows setting CPOL and CPHA appropriately.

| Mode      | Clock polarity  | Clock phase       |
|-----------|-----------------|-------------------|
|           | CPOL            | CPHA              |
| SPI_MODE0 | 0 (Active High) | 0 (Trailing Edge) |
| SPI_MODE1 | 0 (Active High) | 1 (Leading Edge)  |
| SPI_MODE2 | 1 (Active Low)  | 0 (Trailing Edge) |
| SPI_MODE3 | 1 (Active Low)  | 1 (Leading Edge)  |

Table 104: SPI modes

### 6.24.1 Shared resources

The SPI slave shares registers and other resources with other peripherals that have the same ID as the SPI slave. Therefore, you must disable all peripherals that have the same ID as the SPI slave before the SPI slave can be configured and used.

Disabling a peripheral that has the same ID as the SPI slave will not reset any of the registers that are shared with the SPI slave. It is important to configure all relevant SPI slave registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 22 shows which peripherals have the same ID as the SPI slave.

### 6.24.2 EasyDMA

The SPIS implements EasyDMA for accessing RAM without CPU involvement.

The SPIS peripheral implements the following EasyDMA channels:

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 105: SPIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register.

The END event indicates that EasyDMA has finished accessing the buffer in RAM.

### 6.24.3 SPI slave operation

SPI slave uses two memory pointers, RXD.PTR and TXD.PTR, that point to the RXD buffer (receive buffer) and TXD buffer (transmit buffer) respectively. Since these buffers are located in RAM, which can be accessed by both the SPI slave and the CPU, a hardware based semaphore mechanism is implemented to enable safe sharing.

See [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 408.

Before the CPU can safely update the RXD.PTR and TXD.PTR pointers it must first acquire the SPI semaphore. The CPU can acquire the semaphore by triggering the ACQUIRE task and then receiving the ACQUIRED event. When the CPU has updated the RXD.PTR and TXD.PTR pointers the CPU must release the semaphore before the SPI slave will be able to acquire it. The CPU releases the semaphore by triggering

the RELEASE task. This is illustrated in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 408. Triggering the RELEASE task when the semaphore is not granted to the CPU will have no effect.

The semaphore mechanism does not, at any time, prevent the CPU from performing read or write access to the RXD.PTR register, the TXD.PTR registers, or the RAM that these pointers are pointing to. The semaphore is only telling when these can be updated by the CPU so that safe sharing is achieved.

The semaphore is by default assigned to the CPU after the SPI slave is enabled. No ACQUIRED event will be generated for this initial semaphore handover. An ACQUIRED event will be generated immediately if the ACQUIRE task is triggered while the semaphore is assigned to the CPU.

The SPI slave will try to acquire the semaphore when CSN goes low. If the SPI slave does not manage to acquire the semaphore at this point, the transaction will be ignored. This means that all incoming data on MOSI will be discarded, and the DEF (default) character will be clocked out on the MISO line throughout the whole transaction. This will also be the case even if the semaphore is released by the CPU during the transaction. In case of a race condition where the CPU and the SPI slave try to acquire the semaphore at the same time, as illustrated in lifeline item 2 in [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 408, the semaphore will be granted to the CPU.

If the SPI slave acquires the semaphore, the transaction will be granted. The incoming data on MOSI will be stored in the RXD buffer and the data in the TXD buffer will be clocked out on MISO.

When a granted transaction is completed and CSN goes high, the SPI slave will automatically release the semaphore and generate the END event.

As long as the semaphore is available the SPI slave can be granted multiple transactions one after the other. If the CPU is not able to reconfigure the TXD.PTR and RXD.PTR between granted transactions, the same TX data will be clocked out and the RX buffers will be overwritten. To prevent this from happening, the END\_ACQUIRE shortcut can be used. With this shortcut enabled the semaphore will be handed over to the CPU automatically after the granted transaction has completed, giving the CPU the ability to update the TXPTR and RXPTR between every granted transaction.

If the CPU tries to acquire the semaphore while it is assigned to the SPI slave, an immediate handover will not be granted. However, the semaphore will be handed over to the CPU as soon as the SPI slave has released the semaphore after the granted transaction is completed. If the END\_ACQUIRE shortcut is enabled and the CPU has triggered the ACQUIRE task during a granted transaction, only one ACQUIRE request will be served following the END event.

The MAXRX register specifies the maximum number of bytes the SPI slave can receive in one granted transaction. If the SPI slave receives more than MAXRX number of bytes, an OVERFLOW will be indicated in the STATUS register and the incoming bytes will be discarded.

The MAXTX parameter specifies the maximum number of bytes the SPI slave can transmit in one granted transaction. If the SPI slave is forced to transmit more than MAXTX number of bytes, an OVERREAD will be indicated in the STATUS register and the ORC character will be clocked out.

The RXD.AMOUNT and TXD.AMOUNT registers are updated when a granted transaction is completed. The TXD.AMOUNT register indicates how many bytes were read from the TX buffer in the last transaction, that is, ORC (over-read) characters are not included in this number. Similarly, the RXD.AMOUNT register indicates how many bytes were written into the RX buffer in the last transaction.

The ENDRX event is generated when the RX buffer has been filled.

Figure 147: SPI transaction when shortcut between END and ACQUIRE is enabled

#### 6.24.4 Pin configuration

The CSN, SCK, MOSI, and MISO signals associated with the SPI slave are mapped to physical pins according to the configuration specified in the PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers respectively. If the CONNECT field of any of these registers is set to Disconnected, the associated SPI slave signal will not be connected to any physical pins.

The PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO registers and their configurations are only used as long as the SPI slave is enabled, and retained only as long as the device is in System ON mode, see [POWER — Power supply](#) on page 58 chapter for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNFG[n] register. PSEL.CSN, PSEL.SCK, PSEL.MOSI, and PSEL.MISO must only be configured when the SPI slave is disabled.

To secure correct behavior in the SPI slave, the pins used by the SPI slave must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 409 before enabling the SPI slave. This is to secure that the pins used by the SPI slave are driven correctly if the SPI slave itself is temporarily disabled, or if the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the SPI slave is to be recognized by an external SPI master.

The MISO line is set in high impedance as long as the SPI slave is not selected with CSN.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| SPI signal | SPI pin                   | Direction | Output value   | Comment                                      |
|------------|---------------------------|-----------|----------------|--|
| CSN        | As specified in PSEL.CSN  | Input     | Not applicable |  |
| SCK        | As specified in PSEL.SCK  | Input     | Not applicable |  |
| MOSI       | As specified in PSEL.MOSI | Input     | Not applicable |  |
| MISO       | As specified in PSEL.MISO | Input     | Not applicable | Emulates that the SPI slave is not selected. |

Table 106: GPIO configuration before enabling peripheral

## 6.24.5 Registers

| Base address | Peripheral | Instance | Description | Configuration |
|--------------|------------|----------|-------------|---------------|
| 0x40003000   | SPIS       | SPIS0    | SPI slave 0 |               |

| $t_{\text{SPIS,ASA}}$      | CSN to MISO driven                 | 0         |      |      | ns    |
| $t_{\text{SPIS,ASO}}$      | CSN to MISO valid <sup>34</sup>    |           |      | 1000 | ns    |
| $t_{\text{SPIS,DISSO}}$    | CSN to MISO disabled <sup>34</sup> |           |      | 68   | ns    |
| $t_{\text{SPIS,CWH}}$      | CSN inactive time                  | 300       |      |      | ns    |
| $t_{\text{SPIS,VSO}}$      | CLK edge to MISO valid             |           |      | 19   | ns    |
| $t_{\text{SPIS,HSD}}$      | MISO hold time after CLK edge      | $18^{35}$ |      |      | ns    |
| $t_{\text{SPIS,SUSI}}$     | MOSI to CLK edge setup time        | 59        |      |      | ns    |
| $t_{\text{SPIS,HSI}}$      | CLK edge to MOSI hold time         | 20        |      |      | ns    |

<sup>32</sup> High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

<sup>33</sup> The actual maximum data rate depends on the master's CLK to MISO and MOSI setup and hold timings.

<sup>34</sup> At 25pF load, including GPIO capacitance, see GPIO spec.

<sup>35</sup> This is to ensure compatibility to SPI masters sampling MISO on the same edge as MOSI is output

## 6.25 SWI — Software interrupts

A set of interrupts have been reserved for use as software interrupts.

### 6.25.1 Registers

| Base address | Peripheral | Instance | Description          | Configuration |
|--------------|------------|----------|----------------------|---------------|
| 0x40014000   | SWI        | SWI0     | Software interrupt 0 |               |
| 0x40015000   | SWI        | SWI1     | Software interrupt 1 |               |
| 0x40016000   | SWI        | SWI2     | Software interrupt 2 |               |
| 0x40017000   | SWI        | SWI3     | Software interrupt 3 |               |
| 0x40018000   | SWI        | SWI4     | Software interrupt 4 |               |
| 0x40019000   | SWI        | SWI5     | Software interrupt 5 |               |

Table 109: Instances

## 6.26 TEMP — Temperature sensor

The temperature sensor measures die temperature over the temperature range of the device. Linearity compensation can be implemented if required by the application.

Listed here are the main features for TEMP:

- Temperature range is greater than or equal to operating temperature of the device
- Resolution is 0.25 degrees

TEMP is started by triggering the START task.

When the temperature measurement is completed, a DATARDY event will be generated and the result of the measurement can be read from the TEMP register.

To achieve the measurement accuracy stated in the electrical specification, the crystal oscillator must be selected as the HFCLK source, see [CLOCK — Clock control](#) on page 80 for more information.

When the temperature measurement is completed, TEMP analog electronics power down to save power.

TEMP only supports one-shot operation, meaning that every TEMP measurement has to be explicitly started using the START task.

### 6.26.1 Registers

| Base address | Peripheral | Instance | Description        | Configuration |
|--------------|------------|----------|--------------------|---------------|
| 0x4000C000   | TEMP       | TEMP     | Temperature sensor |               |

Table 110: Instances

| Register       | Offset | Description                                  |
|----------------|--------|--|
| TASKS_START    | 0x000  | Start temperature measurement                |
| TASKS_STOP     | 0x004  | Stop temperature measurement                 |
| EVENTS_DATARDY | 0x100  | Temperature measurement complete, data ready |
| INTENSET       | 0x304  | Enable interrupt                             |
| INTENCLR       | 0x308  | Disable interrupt                            |
| TEMP           | 0x508  | Temperature in °C (0.25° steps)              |
| A0             | 0x520  | Slope of first piecewise linear function     |

| Register | Offset | Description                                     |
|----------|--------|---|
| A1       | 0x524  | Slope of second piecewise linear function       |
| A2       | 0x528  | Slope of third piecewise linear function        |
| A3       | 0x52C  | Slope of fourth piecewise linear function       |
| A4       | 0x530  | Slope of fifth piecewise linear function        |
| A5       | 0x534  | Slope of sixth piecewise linear function        |
| B0       | 0x540  | y-intercept of first piecewise linear function  |
| B1       | 0x544  | y-intercept of second piecewise linear function |
| B2       | 0x548  | y-intercept of third piecewise linear function  |
| B3       | 0x54C  | y-intercept of fourth piecewise linear function |
| B4       | 0x550  | y-intercept of fifth piecewise linear function  |
| B5       | 0x554  | y-intercept of sixth piecewise linear function  |
| T0       | 0x560  | End point of first piecewise linear function    |
| T1       | 0x564  | End point of second piecewise linear function   |
| T2       | 0x568  | End point of third piecewise linear function    |
| T3       | 0x56C  | End point of fourth piecewise linear function   |
| T4       | 0x570  | End point of fifth piecewise linear function    |

## 6.27 TWI — I<sup>2</sup>C compatible two-wire interface

The TWI master is compatible with I<sup>2</sup>C operating at 100 kHz and 400 kHz.

Figure 150: TWI master's main features

### 6.27.1 Functional description

This TWI master is not compatible with CBUS. The TWI transmitter and receiver are single buffered.

See, [TWI master's main features](#) on page 429.

A TWI setup comprising one master and three slaves is illustrated in [A typical TWI setup comprising one master and three slaves](#) on page 429. This TWI master is only able to operate as the only master on the TWI bus.

Figure 151: A typical TWI setup comprising one master and three slaves

This TWI master supports clock stretching performed by the slaves. The TWI master is started by triggering the STARTTX or STARTRX tasks, and stopped by triggering the STOP task.

If a NACK is clocked in from the slave, the TWI master will generate an ERROR event.

### 6.27.2 Master mode pin configuration

The different signals SCL and SDA associated with the TWI master are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated TWI signal is not connected to any physical pin. The PSEL.SCL and PSEL.SDA registers and their configurations are only used

as long as the TWI master is enabled, and retained only as long as the device is in ON mode. PSEL.SCL and PSEL.SDA must only be configured when the TWI is disabled.

To secure correct signal levels on the pins used by the TWI master when the system is in OFF mode, and when the TWI master is disabled, these pins must be configured in the GPIO peripheral as described in [GPIO configuration](#) on page 430.

Only one peripheral can be assigned to drive a particular GPIO pin at a time, failing to do so may result in unpredictable behavior.

| TWI master signal | TWI master pin           | Direction | Drive strength | Output value   |
|-------------------|--------------------------|-----------|----------------|----------------|
| SCL               | As specified in PSEL.SCL | Input     | SOD1           | Not applicable |
| SDA               | As specified in PSEL.SDA | Input     | SOD1           | Not applicable |

Table 112: GPIO configuration

### 6.27.3 Shared resources

The TWI shares registers and other resources with other peripherals that have the same ID as the TWI.

Therefore, you must disable all peripherals that have the same ID as the TWI before the TWI can be configured and used. Disabling a peripheral that has the same ID as the TWI will not reset any of the registers that are shared with the TWI. It is therefore important to configure all relevant TWI registers explicitly to secure that it operates correctly.

The Instantiation table in [Instantiation](#) on page 22 shows which peripherals have the same ID as the TWI.

### 6.27.4 Master write sequence

A TWI master write sequence is started by triggering the STARTTX task. After the STARTTX task has been triggered, the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1).

The address must match the address of the slave device that the master wants to write to. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) generated by the slave.

After receiving the ACK bit, the TWI master will clock out the data bytes that are written to the TXD register. Each byte clocked out from the master will be followed by an ACK/NACK bit clocked in from the slave. A TXDSENT event will be generated each time the TWI master has clocked out a TXD byte, and the associated ACK/NACK bit has been clocked in from the slave.

The TWI master transmitter is single buffered, and a second byte can only be written to the TXD register after the previous byte has been clocked out and the ACK/NACK bit clocked in, that is, after the TXDSENT event has been generated.

If the CPU is prevented from writing to TXD when the TWI master is ready to clock out a byte, the TWI master will stretch the clock until the CPU has written a byte to the TXD register.

A typical TWI master write sequence is illustrated in [The TWI master writing data to a slave](#) on page 431. Occurrence 3 in the figure illustrates delayed processing of the TXDSENT event associated with TXD byte 1. In this scenario the TWI master will stretch the clock to prevent writing erroneous data to the slave.

Figure 152: The TWI master writing data to a slave

The TWI master write sequence is stopped when the STOP task is triggered whereupon the TWI master will generate a stop condition on the TWI bus.

### 6.27.5 Master read sequence

A TWI master read sequence is started by triggering the STARTRX task. After the STARTRX task has been triggered the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1).

The address must match the address of the slave device that the master wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK = 1) generated by the slave.

After having sent the ACK bit the TWI slave will send data to the master using the clock generated by the master.

The TWI master will generate a RXDRDY event every time a new byte is received in the RXD register.

After receiving a byte, the TWI master will delay sending the ACK/NACK bit by stretching the clock until the CPU has extracted the received byte, that is, by reading the RXD register.

The TWI master read sequence is stopped by triggering the STOP task. This task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the stop condition.

A typical TWI master read sequence is illustrated in [The TWI master reading data from a slave](#) on page 432. Occurrence 3 in this figure illustrates delayed processing of the RXDRDY event associated with RXD byte B. In this scenario the TWI master will stretch the clock to prevent the slave from overwriting the contents of the RXD register.

Figure 153: The TWI master reading data from a slave

### 6.27.6 Master repeated start sequence

A typical repeated start sequence is one in which the TWI master writes one byte to the slave followed by reading M bytes from the slave. Any combination and number of transmit and receive sequences can be combined in this fashion. Only one shortcut to STOP can be enabled at any given time.

The figure below illustrates a repeated start sequence where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between.

Figure 154: A repeated start sequence, where the TWI master writes one byte, followed by reading M bytes from the slave without performing a stop in-between

To generate a repeated start after a read sequence, a second start task must be triggered instead of the STOP task, that is, STARTRX or STARTTX. This start task must be triggered before the last byte is extracted from RXD to ensure that the TWI master sends a NACK back to the slave before generating the repeated start condition.

### 6.27.7 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

### 6.27.8 Registers

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40003000   | TWI        | TWI0     | Two-wire interface master 0 | Deprecated    |
| 0x40004000   | TWI        | TWI1     | Two-wire interface master 1 | Deprecated    |

Table 113: Instances

| Register         | Offset | Description  |
|------------------|--------|--|
| TASKS_STARTRX    | 0x000  | Start TWI receive sequence   |

## 6.27.9 Electrical specification

### 6.27.9.1 TWI interface electrical specifications

| Symbol                 | Description  | Min. | Typ. | Max. | Units         |
|------------------------|--|------|------|------|---------------|
| $f_{\text{TWI,SCL}}$   | Bit rates for TWI <sup>36</sup>                        | 100  |      | 400  | kbps          |
| $t_{\text{TWI,START}}$ | Time from STARTRX/STARTTX task to transmission started |      | 1.5  |      | $\mu\text{s}$ |

### 6.27.9.2 Two Wire Interface (TWI) timing specifications

| Symbol                           | Description   | Min.  | Typ. | Max. | Units |
|----------------------------------|---|-------|------|------|-------|
| $t_{\text{TWI,SU\_DAT}}$         | Data setup time before positive edge on SCL – all modes               | 300   |      |      | ns    |
| $t_{\text{TWI,HD\_DAT}}$         | Data hold time after negative edge on SCL – all modes                 | 500   |      |      | ns    |
| $t_{\text{TWI,HD\_STA,100kbps}}$ | TWI master hold time for START and repeated START condition, 100 kbps | 10000 |      |      | ns    |
| $t_{\text{TWI,HD\_STA,250kbps}}$ | TWI master hold time for START and repeated START condition, 250kbps  | 4000  |      |      | ns    |
| $t_{\text{TWI,HD\_STA,400kbps}}$ | TWI master hold time for START and repeated START condition, 400 kbps | 2500  |      |      | ns    |
| $t_{\text{TWI,SU\_STO,100kbps}}$ | TWI master setup time from SCL high to STOP condition, 100 kbps       | 5000  |      |      | ns    |
| $t_{\text{TWI,SU\_STO,250kbps}}$ | TWI master setup time from SCL high to STOP condition, 250 kbps       | 2000  |      |      | ns    |
| $t_{\text{TWI,SU\_STO,400kbps}}$ | TWI master setup time from SCL high to STOP condition, 400 kbps       | 1250  |      |      | ns    |
| $t_{\text{TWI,BUF,100kbps}}$     | TWI master bus free time between STOP and START conditions, 100 kbps  | 5800  |      |      | ns    |
| $t_{\text{TWI,BUF,250kbps}}$     | TWI master bus free time between STOP and START conditions, 250 kbps  | 2700  |      |      | ns    |
| $t_{\text{TWI,BUF,400kbps}}$     | TWI master bus free time between STOP and START conditions, 400 kbps  | 2100  |      |      | ns    |

Figure 155: TWI timing diagram, 1 byte transaction

## 6.28 TIMER — Timer/counter

The TIMER can operate in two modes: timer and counter.

<sup>36</sup> High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 156: Block schematic for timer/counter

The timer/counter runs on the high-frequency clock source (HFCLK) and includes a four-bit (1/2X) prescaler that can divide the timer input clock from the HFCLK controller. Clock source selection between PCLK16M and PCLK1M is automatic according to TIMER base frequency set by the prescaler. The TIMER base frequency is always given as 16 MHz divided by the prescaler value.

The PPI system allows a TIMER event to trigger a task of any other system peripheral of the device. The PPI system also enables the TIMER task/event features to generate periodic output and PWM signals to any GPIO. The number of input/outputs used at the same time is limited by the number of GPIOTE channels.

The TIMER can operate in two modes, Timer mode and Counter mode. In both modes, the TIMER is started by triggering the START task, and stopped by triggering the STOP task. After the timer is stopped the timer can resume timing/counting by triggering the START task again. When timing/counting is resumed, the timer will continue from the value it had prior to being stopped.

In Timer mode, the TIMER's internal Counter register is incremented by one for every tick of the timer frequency  $f_{\text{TIMER}}$  as illustrated in [Block schematic for timer/counter](#) on page 442. The timer frequency is derived from PCLK16M as shown below, using the values specified in the PRESCALER register:

$$f_{\text{TIMER}} = 16 \text{ MHz} / (2^{\text{PRESCALER}})$$

When  $f_{\text{TIMER}} \leq 1 \text{ MHz}$  the TIMER will use PCLK1M instead of PCLK16M for reduced power consumption.

In counter mode, the TIMER's internal Counter register is incremented by one each time the COUNT task is triggered, that is, the timer frequency and the prescaler are not utilized in counter mode. Similarly, the COUNT task has no effect in Timer mode.

The TIMER's maximum value is configured by changing the bit-width of the timer in the [BITMODE](#) on page 447 register.

[PRESCALER](#) on page 447 and the [BITMODE](#) on page 447 must only be updated when the timer is stopped. If these registers are updated while the TIMER is started then this may result in unpredictable behavior.

When the timer is incremented beyond its maximum value the Counter register will overflow and the TIMER will automatically start over from zero.

The Counter register can be cleared, that is, its internal value set to zero explicitly, by triggering the CLEAR task.

The TIMER implements multiple capture/compare registers.

Independent of prescaler setting the accuracy of the TIMER is equivalent to one tick of the timer frequency  $f_{\text{TIMER}}$  as illustrated in [Block schematic for timer/counter](#) on page 442.

### 6.28.1 Capture

The TIMER implements one capture task for every available capture/compare register.

Every time the CAPTURE[n] task is triggered, the Counter value is copied to the CC[n] register.

### 6.28.2 Compare

The TIMER implements one COMPARE event for every available capture/compare register.

A COMPARE event is generated when the Counter is incremented and then becomes equal to the value specified in one of the capture compare registers. When the Counter value becomes equal to the value specified in a capture compare register CC[n], the corresponding compare event COMPARE[n] is generated.

**BITMODE** on page 447 specifies how many bits of the Counter register and the capture/compare register that are used when the comparison is performed. Other bits will be ignored.

### 6.28.3 Task delays

After the TIMER is started, the CLEAR task, COUNT task and the STOP task will guarantee to take effect within one clock cycle of the PCLK16M.

### 6.28.4 Task priority

If the START task and the STOP task are triggered at the same time, that is, within the same period of PCLK16M, the STOP task will be prioritized.

### 6.28.5 Registers

| Base address | Peripheral | Instance | Description | Configuration                                     |
|--------------|------------|----------|-------------|---|
| 0x40008000   | TIMER      | TIMER0   | Timer 0     | This timer instance has 4 CC registers (CC[0..3]) |
| 0x40009000   | TIMER      | TIMER1   | Timer 1     | This timer instance has 4 CC registers (CC[0..3]) |
| 0x4000A000   | TIMER      | TIMER2   | Timer 2     | This timer instance has 4 CC registers (CC[0..3]) |
| 0x4001A000   | TIMER      | TIMER3   | Timer 3     | This timer instance has 6 CC registers (CC[0..5]) |
| 0x4001B000   | TIMER      | TIMER4   | Timer 4     | This timer instance has 6 CC registers (CC[0..5]) |

Table 115: Instances

| Register    | Offset | Description                         |
|-------------|--------|-------------------------------------|
| TASKS_START | 0x000  | Start Timer                         |
| TASKS_STOP  | 0x004  | Stop Timer                          |
| TASKS_COUNT | 0x008  | Increment Timer (Counter mode only) |
| TASKS_CLEAR | 0x00C  | Clear time                          |

| Register          | Offset | Description                                    |            |
|-------------------|--------|--|------------|
| TASKS_SHUTDOWN    | 0x010  | Shut down timer                                | Deprecated |
| TASKS_CAPTURE[0]  | 0x040  | Capture Timer value to CC[0] register          |            |

Only the number of bits indicated by BITMODE will be used by the TIMER.

## 6.29 TWIM — I<sup>2</sup>C compatible two-wire interface master with EasyDMA

TWI master with EasyDMA (TWIM) is a two-wire half-duplex master which can communicate with multiple slave devices connected to the same bus

Listed here are the main features for TWIM:

- I<sup>2</sup>C compatible
- Supported baud rates: 100, 250, 400 kbps
- Support for clock stretching (non I<sup>2</sup>C compliant)
- EasyDMA

The two-wire interface can communicate with a bi-directional wired-AND bus with two lines (SCL, SDA). The protocol makes it possible to interconnect up to 127 individually addressable devices. TWIM is not compatible with CBUS.

The GPIOs used for each two-wire interface line can be chosen from any GPIO on the device and are independently configurable. This enables great flexibility in device pinout and efficient use of board space and signal routing.

Figure 157: TWI master with EasyDMA

A typical TWI setup consists of one master and one or more slaves. For an example, see [A typical TWI setup comprising one master and three slaves](#) on page 449. This TWIM is only able to operate as a single master on the TWI bus. Multi-master bus configuration is not supported.

Figure 158: A typical TWI setup comprising one master and three slaves

This TWI master supports clock stretching performed by the slaves. Note that the SCK pulse following a stretched clock cycle may be shorter than specified by the I2C specification.

The TWI master is started by triggering the STARTTX or STARTRX tasks, and stopped by triggering the STOP task. The TWI master will generate a STOPPED event when it has stopped following a STOP task. The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

After the TWI master is started, the STARTTX task or the STARTRX task should not be triggered again before the TWI master has stopped, i.e. following a LASTRX, LASTTX or STOPPED event.

If a NACK is clocked in from the slave, the TWI master will generate an ERROR event.

### 6.29.1 EasyDMA

The TWIM implements EasyDMA for accessing RAM without CPU involvement.

The TWIM peripheral implements the following EasyDMA channels:

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 117: TWIM EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next RX/TX transmission immediately after having received the RXSTARTED/TXSTARTED event.

The STOPPED event indicates that EasyDMA has finished accessing the buffer in RAM.

### 6.29.2 Master write sequence

A TWI master write sequence is started by triggering the STARTTX task. After the STARTTX task has been triggered, the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1).

The address must match the address of the slave device that the master wants to write to. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) generated by the slave.

After receiving the ACK bit, the TWI master will clock out the data bytes found in the transmit buffer located in RAM at the address specified in the TXD.PTR register. Each byte clocked out from the master will be followed by an ACK/NACK bit clocked in from the slave.

A typical TWI master write sequence is illustrated in [TWI master writing data to a slave](#) on page 450. Occurrence 2 in the figure illustrates clock stretching performed by the TWI master following a SUSPEND task.

A SUSPENDED event indicates that the SUSPEND task has taken effect; this event can be used to synchronize the software.

Figure 159: TWI master writing data to a slave

The TWI master will generate a LASTTX event when it starts to transmit the last byte, this is illustrated in [TWI master writing data to a slave](#) on page 450

The TWI master is stopped by triggering the STOP task, this task should be triggered during the transmission of the last byte to secure that the TWI will stop as fast as possible after sending the last byte. It is safe to use the shortcut between LASTTX and STOP to accomplish this.

Note that the TWI master does not stop by itself when the whole RAM buffer has been sent, or when an error occurs. The STOP task must be issued, through the use of a local or PPI shortcut, or in software as part of the error handler.

The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

### 6.29.3 Master read sequence

A TWI master read sequence is started by triggering the STARTRX task. After the STARTRX task has been triggered the TWI master will generate a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1). The address must match the address of the slave device that the master wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK = 1) generated by the slave.

After having sent the ACK bit the TWI slave will send data to the master using the clock generated by the master.

Data received will be stored in RAM at the address specified in the RXD.PTR register. The TWI master will generate an ACK after all but the last byte received from the slave. The TWI master will generate a NACK after the last byte received to indicate that the read sequence shall stop.

A typical TWI master read sequence is illustrated in [The TWI master reading data from a slave](#) on page 452. Occurrence 2 in the figure illustrates clock stretching performed by the TWI master following a SUSPEND task.

A SUSPENDED event indicates that the SUSPEND task has taken effect; this event can be used to synchronize the software.

The TWI master will generate a LASTRX event when it is ready to receive the last byte, this is illustrated in [The TWI master reading data from a slave](#) on page 452. If RXD.MAXCNT > 1 the LASTRX event is generated after sending the ACK of the previously received byte. If RXD.MAXCNT = 1 the LASTRX event is generated after receiving the ACK following the address and READ bit.

The TWI master is stopped by triggering the STOP task, this task must be triggered before the NACK bit is supposed to be transmitted. The STOP task can be triggered at any time during the reception of the last byte. It is safe to use the shortcut between LASTRX and STOP to accomplish this.

Note that the TWI master does not stop by itself when the RAM buffer is full, or when an error occurs. The STOP task must be issued, through the use of a local or PPI shortcut, or in software as part of the error handler.

The TWI master cannot get stopped while it is suspended, so the STOP task has to be issued after the TWI master has been resumed.

Figure 160: The TWI master reading data from a slave

### 6.29.4 Master repeated start sequence

A typical repeated start sequence is one in which the TWI master writes two bytes to the slave followed by reading four bytes from the slave. This example uses shortcuts to perform the simplest type of repeated start sequence, i.e. one write followed by one read. The same approach can be used to perform a repeated start sequence where the sequence is read followed by write.

The figure [A repeated start sequence, where the TWI master writes two bytes followed by reading 4 bytes from the slave](#) on page 452 illustrates this:

Figure 161: A repeated start sequence, where the TWI master writes two bytes followed by reading 4 bytes from the slave

If a more complex repeated start sequence is needed and the TWI firmware drive is serviced in a low priority interrupt it may be necessary to use the SUSPEND task and SUSPENDED event to guarantee that the correct tasks are generated at the correct time. This is illustrated in [A double repeated start sequence using the SUSPEND task to secure safe operation in low priority interrupts](#) on page 453.

Figure 162: A double repeated start sequence using the *SUSPEND* task to secure safe operation in low priority interrupts

### 6.29.5 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

### 6.29.6 Master mode pin configuration

The SCL and SDA signals associated with the TWI master are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used as long as the TWI master is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register. PSEL.SCL, PSEL.SDA must only be configured when the TWI master is disabled.

To secure correct signal levels on the pins used by the TWI master when the system is in OFF mode, and when the TWI master is disabled, these pins must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 453.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| TWI master signal | TWI master pin           | Direction | Output value   | Drive strength |
|-------------------|--------------------------|-----------|----------------|----------------|
| SCL               | As specified in PSEL.SCL | Input     | Not applicable | S0D1           |
| SDA               | As specified in PSEL.SDA | Input     | Not applicable | S0D1           |

Table 118: GPIO configuration before enabling peripheral

### 6.29.7 Registers

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40003000   | TWIM       | TWIM0    | Two-wire interface master 0 |               |
| 0x40004000   | TWIM       | TWIM1    | Two-wire interface master 1 |               |

Table 119: Instances

| Register         | Offset | Description   |
|------------------|--------|---|
| TASKS_STARTRX    | 0x000  | Start TWI receive sequence  |
| TASKS_STARTTX    | 0x008  | Start TWI transmit sequence   |
| TASKS_STOP       | 0x014  | Stop TWI transaction. Must be issued while the TWI master is not suspended.                       |
| TASKS_SUSPEND    | 0x01C  | Suspend TWI transaction   |
| TASKS_RESUME     | 0x020  | Resume TWI transaction  |
| EVENTS_STOPPED   | 0x104  | TWI stopped   |
| EVENTS_ERROR     | 0x124  | TWI error   |
| EVENTS_SUSPENDED | 0x148  | Last byte has been sent out after the SUSPEND task has been issued, TWI traffic is now suspended. |
| EVENTS_RXSTARTED | 0x14C  | Receive sequence started  |
| EVENTS_TXSTARTED | 0x150  | Transmit sequence started   |
| EVENTS_LASTRX    | 0x15C  | Byte boundary, starting to receive the last byte  |
| EVENTS_LASTTX    | 0x160  | Byte boundary, starting to transmit the last byte   |
| SHORTS           | 0x200  | Shortcuts between local events and tasks  |
| INTEN            | 0x300  | Enable or disable interrupt   |
| INTENSET         | 0x304  | Enable interrupt  |
| INTENCLR         | 0x308  | Disable interrupt   |
| ERRORSRC         | 0x4C4  | Error source  |
| ENABLE           | 0x500  | Enable TWIM   |
| PSEL.SCL         | 0x508  | Pin select for SCL signal   |
| PSEL.SDA         | 0x50C  | Pin select for SDA signal   |
| FREQUENCY        | 0x524  | TWI frequency. Accuracy depends on the HFCLK source selected.                                     |
| RXD.PTR          | 0x534  | Data pointer  |
| RXD.MAXCNT       | 0x538  | Maximum number of bytes in receive buffer   |
| RXD.AMOUNT       | 0x53C  | Number of bytes transferred in the last transaction   |
| RXD.LIST         | 0x540  | EasyDMA list type   |
| TXD.PTR          | 0x544  | Data pointer  |
| TXD.MAXCNT       | 0x548  | Maximum number of bytes in transmit buffer  |
| TXD.AMOUNT       | 0x54C  | Number of bytes transferred in the last transaction   |
| TXD.LIST         | 0x550  | EasyDMA list type   |
| ADDRESS          | 0x588  | Address used in the TWI transfer  |

## 6.29.8 Electrical specification

### 6.29.8.1 TWIM interface electrical specifications

| Symbol           | Description  | Min. | Typ. | Max. | Units   |
|------------------|--|------|------|------|---------|
| $f_{TWIM,SCL}$   | Bit rates for TWIM <sup>37</sup>                       | 100  |      | 400  | kbps    |
| $t_{TWIM,START}$ | Time from STARTRX/STARTTX task to transmission started |      | 1.5  |      | $\mu$ s |

### 6.29.8.2 Two Wire Interface Master (TWIM) timing specifications

| Symbol                    | Description  | Min.   | Typ. | Max. | Units |
|---------------------------|--|--------|------|------|-------|
| $t_{TWIM,SU,DAT}$         | Data setup time before positive edge on SCL – all modes                | 300    |      |      | ns    |
| $t_{TWIM,HD,DAT}$         | Data hold time after negative edge on SCL – all modes                  | 500    |      |      | ns    |
| $t_{TWIM,HD,STA,100kbps}$ | TWIM master hold time for START and repeated START condition, 100 kbps | 9937.5 |      |      | ns    |
| $t_{TWIM,HD,STA,250kbps}$ | TWIM master hold time for START and repeated START condition, 250kbps  | 3937.5 |      |      | ns    |
| $t_{TWIM,HD,STA,400kbps}$ | TWIM master hold time for START and repeated START condition, 400 kbps | 2437.5 |      |      | ns    |
| $t_{TWIM,SU,STO,100kbps}$ | TWIM master setup time from SCL high to STOP condition, 100 kbps       | 5000   |      |      | ns    |
| $t_{TWIM,SU,STO,250kbps}$ | TWIM master setup time from SCL high to STOP condition, 250 kbps       | 2000   |      |      | ns    |
| $t_{TWIM,SU,STO,400kbps}$ | TWIM master setup time from SCL high to STOP condition, 400 kbps       | 1250   |      |      | ns    |
| $t_{TWIM,BUF,100kbps}$    | TWIM master bus free time between STOP and START conditions, 100 kbps  | 5800   |      |      | ns    |
| $t_{TWIM,BUF,250kbps}$    | TWIM master bus free time between STOP and START conditions, 250 kbps  | 2700   |      |      | ns    |
| $t_{TWIM,BUF,400kbps}$    | TWIM master bus free time between STOP and START conditions, 400 kbps  | 2100   |      |      | ns    |

<sup>37</sup> High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 163: TWIM timing diagram, 1 byte transaction

### 6.29.9 Pullup resistor

Figure 164: Recommended TWIM pullup value vs. line capacitance

- The I2C specification allows a line capacitance of 400 pF at most.
- The value of internal pullup resistor ( $R_{PU}$ ) for nRF52833 can be found in [GPIO — General purpose input/output](#) on page 138.

## 6.30 TWIS — I<sup>2</sup>C compatible two-wire interface slave with EasyDMA

TWI slave with EasyDMA (TWIS) is compatible with I<sup>2</sup>C operating at 100 kHz and 400 kHz. The TWI transmitter and receiver implement EasyDMA.

Figure 165: TWI slave with EasyDMA

A typical TWI setup consists of one master and one or more slaves. For an example, see the following figure. TWIS is only able to operate with a single master on the TWI bus.

Figure 166: A typical TWI setup comprising one master and three slaves

The following figure shows the TWI slave state machine.

Figure 167: TWI slave state machine

The following table contains descriptions of the symbols used in the state machine.

| Symbol            | Type         | Description   |
|-------------------|--------------|---|
| ENABLE            | Register     | The TWI slave has been enabled via the <code>ENABLE</code> register.  |
| PREPARETX         | Task         | The <code>TASKS_PREPARETX</code> task has been triggered.   |
| STOP              | Task         | The <code>TASKS_STOP</code> task has been triggered.  |
| PREPARERX         | Task         | The <code>TASKS_PREPARERX</code> task has been triggered.   |
| STOPPED           | Event        | The <code>EVENTS_STOPPED</code> event was generated.  |
| RXSTARTED         | Event        | The <code>EVENTS_RXSTARTED</code> event was generated.  |
| TXSTARTED         | Event        | The <code>EVENTS_TXSTARTED</code> event was generated.  |
| TX prepared       | Internal     | Internal flag indicating that a <code>TASKS_PREPARETX</code> task has been triggered. This flag is not visible to the user. |
| RX prepared       | Internal     | Internal flag indicating that a <code>TASKS_PREPARERX</code> task has been triggered. This flag is not visible to the user. |
| Unprepare TX      | Internal     | Clears the internal 'TX prepared' flag until next <code>TASKS_PREPARETX</code> task.  |
| Unprepare RX      | Internal     | Clears the internal 'RX prepared' flag until next <code>TASKS_PREPARERX</code> task.  |
| Stop condition    | TWI protocol | A TWI stop condition was detected.  |
| Restart condition | TWI protocol | A TWI restart condition was detected.   |

Table 121: TWI slave state machine symbols

The TWI slave can perform clock stretching, with the premise that the master is able to support it.

The TWI slave operates in a low power mode while waiting for a TWI master to initiate a transfer. As long as the TWI slave is not addressed, it will remain in this low power mode.

To secure correct behavior of the TWI slave, PSEL.SCL, PSEL.SDA, CONFIG, and the ADDRESS[n] registers must be configured prior to enabling the TWI slave through the ENABLE register. Similarly, changing these settings must be performed while the TWI slave is disabled. Failing to do so may result in unpredictable behavior.

### 6.30.1 EasyDMA

The TWIS implements EasyDMA for accessing RAM without CPU involvement.

The following table shows the Easy DMA channels that the TWIS peripheral implements.

| Channel | Type   | Register Cluster |
|---------|--------|------------------|
| TXD     | READER | TXD              |
| RXD     | WRITER | RXD              |

Table 122: TWIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 44.

The STOPPED event indicates that EasyDMA has finished accessing the buffer in RAM.

### 6.30.2 TWI slave responding to a read command

Before the TWI slave can respond to a read command, the TWI slave must be configured correctly and enabled via the ENABLE register. When enabled, the TWI slave will be in its IDLE state. .

A read command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the TWI slave.

The TWI slave is able to listen for up to two addresses at the same time. This is configured in the ADDRESS registers and the CONFIG register.

The TWI slave will only acknowledge (ACK) the read command if the address presented by the master matches one of the addresses the slave is configured to listen for. The TWI slave will generate a READ event when it acknowledges the read command.

The TWI slave is only able to detect a read command from the IDLE state.

The TWI slave will set an internal 'TX prepared' flag when the PREPARETX task is triggered.

When the read command is received, the TWI slave will enter the TX state if the internal 'TX prepared' flag is set.

If the internal 'TX prepared' flag is not set when the read command is received, the TWI slave will stretch the master's clock until the PREPARETX task is triggered and the internal 'TX prepared' flag is set.

The TWI slave will generate the TXSTARTED event and clear the 'TX prepared' flag ('unprepare TX') when it enters the TX state. In this state the TWI slave will send the data bytes found in the transmit buffer to the master using the master's clock.

The TWI slave will go back to the IDLE state if the TWI slave receives a restart command when it is in the TX state.

The TWI slave is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. The TWI slave will clear the 'TX prepared' flag ('unprepare TX') and go back to the IDLE state when it has stopped.

The transmit buffer is located in RAM at the address specified in the TXD.PTR register. The TWI slave will only be able to send TXD.MAXCNT bytes from the transmit buffer for each transaction. If the TWI master forces the slave to send more than TXD.MAXCNT bytes, the slave will send the byte specified in the ORC register to the master instead. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, see TXD.PTR etc., are latched when the TXSTARTED event is generated.

The TWI slave can be forced to stop by triggering the STOP task. A STOPPED event will be generated when the TWI slave has stopped. The TWI slave will clear the 'TX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 471.

Each byte sent from the slave will be followed by an ACK/NACK bit sent from the master. The TWI master will generate a NACK following the last byte that it wants to receive to tell the slave to release the bus so that the TWI master can generate the stop condition. The TXD.AMOUNT register can be queried after a transaction to see how many bytes were sent.

A typical TWI slave read command response is shown in the following figure. Occurrence 2 in the figure illustrates clock stretching performed by the TWI slave following a SUSPEND task.

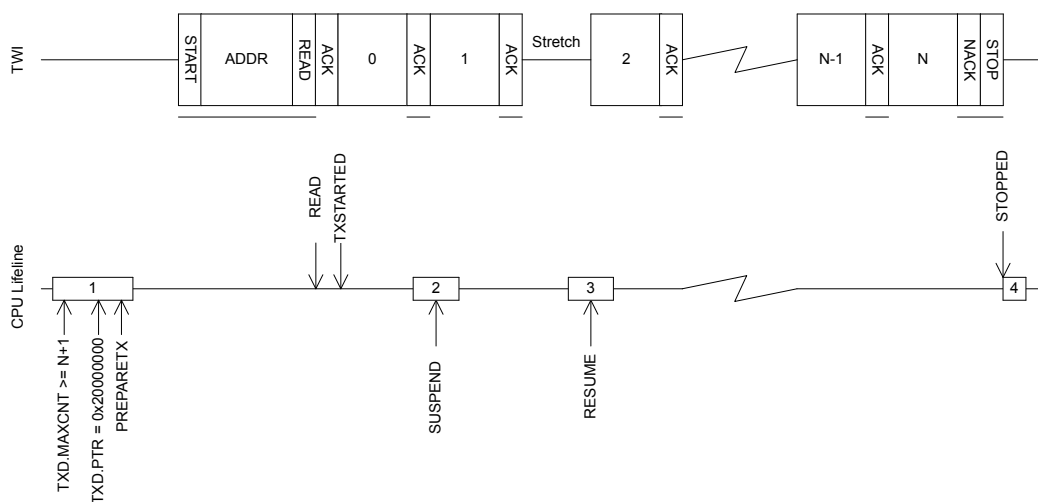

Figure 168: The TWI slave responding to a read command

### 6.30.3 TWI slave responding to a write command

Before the TWI slave can respond to a write command, the TWI slave must be configured correctly and enabled via the ENABLE register. When enabled, the TWI slave will be in its IDLE state.

A write command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the slave.

The TWI slave is able to listen for up to two addresses at the same time. This is configured in the ADDRESS registers and the CONFIG register.

The TWI slave will only acknowledge (ACK) the write command if the address presented by the master matches one of the addresses the slave is configured to listen for. The TWI slave will generate a WRITE event if it acknowledges the write command.

The TWI slave is only able to detect a write command from the IDLE state.

The TWI slave will set an internal 'RX prepared' flag when the PREPARERX task is triggered.

When the write command is received, the TWI slave will enter the RX state if the internal 'RX prepared' flag is set.

If the internal 'RX prepared' flag is not set when the write command is received, the TWI slave will stretch the master's clock until the PREPARERX task is triggered and the internal 'RX prepared' flag is set.

The TWI slave will generate the RXSTARTED event and clear the internal 'RX prepared' flag ('unprepare RX') when it enters the RX state. In this state, the TWI slave will be able to receive the bytes sent by the TWI master.

The TWI slave will go back to the IDLE state if the TWI slave receives a restart command when it is in the RX state.

The TWI slave is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. The TWI slave will clear the internal 'RX prepared' flag ('unprepare RX') and go back to the IDLE state when it has stopped.

The receive buffer is located in RAM at the address specified in the RXD.PTR register. The TWI slave will only be able to receive as many bytes as specified in the RXD.MAXCNT register. If the TWI master tries to send more bytes to the slave than it can receive, the extra bytes are discarded and NACKED by the slave. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, see RXD.PTR etc., are latched when the RXSTARTED event is generated.

The TWI slave can be forced to stop by triggering the STOP task. A STOPPED event will be generated when the TWI slave has stopped. The TWI slave will clear the internal 'RX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 471.

The TWI slave will generate an ACK after every byte received from the master. The RXD.AMOUNT register can be queried after a transaction to see how many bytes were received.

A typical TWI slave write command response is shown in the following figure. Occurrence 2 in the figure illustrates clock stretching performed by the TWI slave following a SUSPEND task.

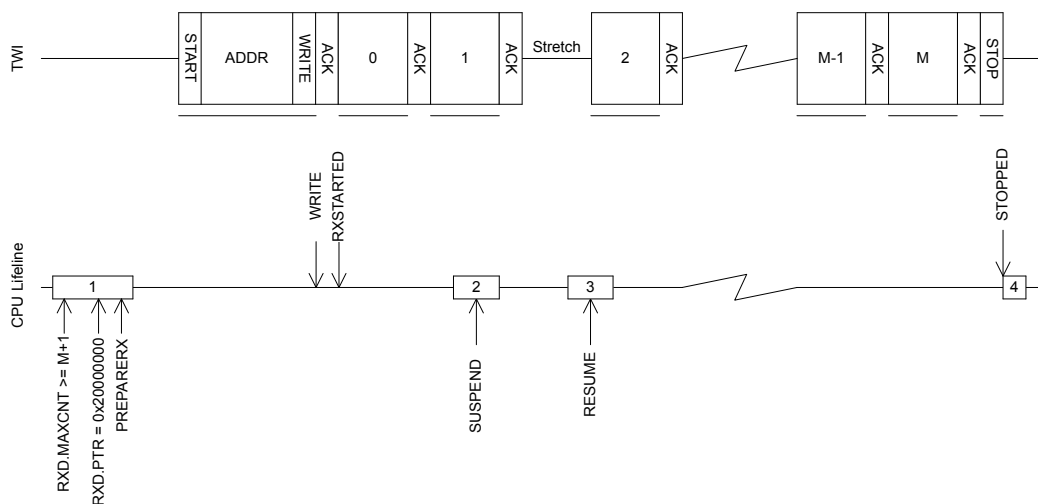

Figure 169: The TWI slave responding to a write command

### 6.30.4 Master repeated start sequence

An example of a repeated start sequence is one in which the TWI master writes two bytes to the slave followed by reading four bytes from the slave.

This is illustrated in the following figure.

In this example, the receiver does not know what the master wants to read in advance. This information is in the first two received bytes of the write in the repeated start sequence. To guarantee that the CPU is able to process the received data before the TWI slave starts to reply to the read command, the SUSPEND task is triggered via a shortcut from the READ event generated when the read command is received. When

the CPU has processed the incoming data and prepared the correct data response, the CPU will resume the transaction by triggering the RESUME task.

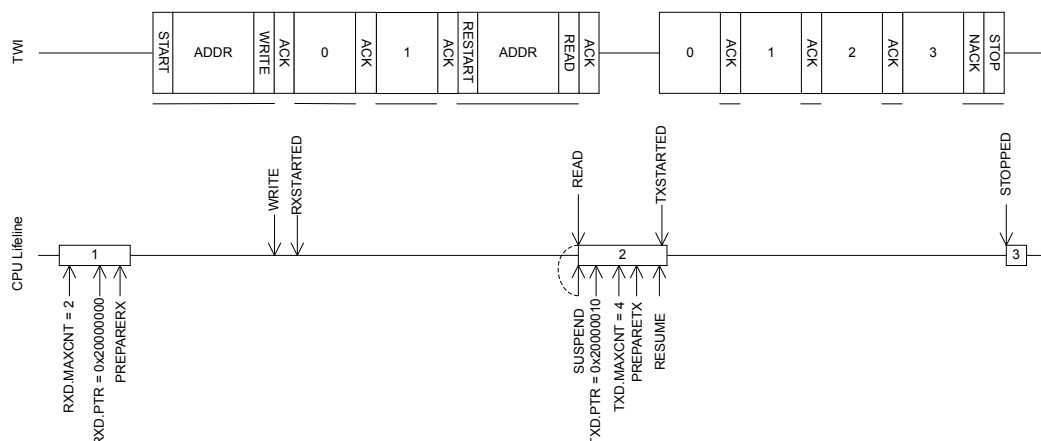

Figure 170: Repeated start sequence

### 6.30.5 Terminating an ongoing TWI transaction

In some situations, e.g. if the external TWI master is not responding correctly, it may be required to terminate an ongoing transaction.

This can be achieved by triggering the STOP task. In this situation, a STOPPED event will be generated when the TWI has stopped independent of whether or not a STOP condition has been generated on the TWI bus. The TWI slave will release the bus when it has stopped and go back to its IDLE state.

### 6.30.6 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOP task may not be always needed (the peripheral might already be stopped), but if it is sent, software shall wait until the STOPPED event was received as a response before disabling the peripheral through the ENABLE register.

### 6.30.7 Slave mode pin configuration

The SCL and SDA signals associated with the TWI slave are mapped to physical pins according to the configuration specified in the PSEL.SCL and PSEL.SDA registers respectively.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used as long as the TWI slave is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register. PSEL.SCL and PSEL.SDA must only be configured when the TWI slave is disabled.

To secure correct signal levels on the pins used by the TWI slave when the system is in OFF mode, and when the TWI slave is disabled, these pins must be configured in the GPIO peripheral as described in the following table.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| TWI slave signal | TWI slave pin            | Direction | Output value   | Drive strength |
|------------------|--------------------------|-----------|----------------|----------------|
| SCL              | As specified in PSEL.SCL | Input     | Not applicable | S0D1           |
| SDA              | As specified in PSEL.SDA | Input     | Not applicable | S0D1           |

Table 123: GPIO configuration before enabling peripheral

## 6.30.8 Registers

| Base address | Peripheral | Instance | Description                | Configuration |
|--------------|------------|----------|----------------------------|---------------|
| 0x40003000   | TWIS       | TWIS0    | Two-wire interface slave 0 |               |
| 0x40004000   | TWIS       | TWIS1    | Two-wire interface slave 1 |               |

Table 124: Instances

| Register         | Offset | Description   |
|------------------|--------|---|
| TASKS_STOP       | 0x014  | Stop TWI transaction  |
| TASKS_SUSPEND    | 0x01C  | Suspend TWI transaction   |
| TASKS_RESUME     | 0x020  | Resume TWI transaction  |
| TASKS_PREPARERX  | 0x030  | Prepare the TWI slave to respond to a write command                                     |
| TASKS_PREPARETX  | 0x034  | Prepare the TWI slave to respond to a read command                                      |
| EVENTS_STOPPED   | 0x104  | TWI stopped   |
| EVENTS_ERROR     | 0x124  | TWI error   |
| EVENTS_RXSTARTED | 0x14C  | Receive sequence started  |
| EVENTS_TXSTARTED | 0x150  | Transmit sequence started   |
| EVENTS_WRITE     | 0x164  | Write command received  |
| EVENTS_READ      | 0x168  | Read command received   |
| SHORTS           | 0x200  | Shortcuts between local events and tasks  |
| INTEN            | 0x300  | Enable or disable interrupt   |
| INTENSET         | 0x304  | Enable interrupt  |
| INTENCLR         | 0x308  | Disable interrupt   |
| ERRORSRC         | 0x4D0  | Error source  |
| MATCH            | 0x4D4  | Status register indicating which address had a match                                    |
| ENABLE           | 0x500  | Enable TWIS   |
| PSEL.SCL         | 0x508  | Pin select for SCL signal   |
| PSEL.SDA         | 0x50C  | Pin select for SDA signal   |
| RXD.PTR          | 0x534  | RXD Data pointer  |
| RXD.MAXCNT       | 0x538  | Maximum number of bytes in RXD buffer   |
| RXD.AMOUNT       | 0x53C  | Number of bytes transferred in the last RXD transaction                                 |
| RXD.LIST         | 0x540  | EasyDMA list type   |
| TXD.PTR          | 0x544  | TXD Data pointer  |
| TXD.MAXCNT       | 0x548  | Maximum number of bytes in TXD buffer   |
| TXD.AMOUNT       | 0x54C  | Number of bytes transferred in the last TXD transaction                                 |
| TXD.LIST         | 0x550  | EasyDMA list type   |
| ADDRESS[0]       | 0x588  | TWI slave address 0   |
| ADDRESS[1]       | 0x58C  | TWI slave address 1   |
| CONFIG           | 0x594  | Configuration register for the address match mechanism                                  |
| ORC              | 0x5C0  | Over-read character. Character sent out in case of an over-read of the transmit buffer. |

Table 125: Register overview

### 6.30.8.1 TASKS\_STOP

Address offset: 0x014

Stop TWI transaction

| Bit number       | 31  | 30       | 29    | 28                                   | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

## 6.30.9 Electrical specification

### 6.30.9.1 TWIS slave timing specifications

| Symbol                     | Description   | Min. | Typ. | Max. | Units   |
|----------------------------|---|------|------|------|---------|
| $f_{TWIS,SCL}$             | Bit rates for TWIS <sup>38</sup>  | 100  |      | 400  | kbps    |
| $t_{TWIS,START}$           | Time from PREPARERX/PREPARETX task to ready to receive/transmit             |      | 1.5  |      | $\mu$ s |
| $t_{TWIS,SU\_DAT}$         | Data setup time before positive edge on SCL – all modes                     | 300  |      |      | ns      |
| $t_{TWIS,HD\_DAT}$         | Data hold time after negative edge on SCL – all modes                       | 500  |      |      | ns      |
| $t_{TWIS,HD\_STA,100kbps}$ | TWI slave hold time from for START condition (SDA low to SCL low), 100 kbps | 5200 |      |      | ns      |
| $t_{TWIS,HD\_STA,400kbps}$ | TWI slave hold time from for START condition (SDA low to SCL low), 400 kbps | 1300 |      |      | ns      |
| $t_{TWIS,SU\_STO,100kbps}$ | TWI slave setup time from SCL high to STOP condition, 100 kbps              | 5200 |      |      | ns      |
| $t_{TWIS,SU\_STO,400kbps}$ | TWI slave setup time from SCL high to STOP condition, 400 kbps              | 1300 |      |      | ns      |
| $t_{TWIS,BUF,100kbps}$     | TWI slave bus free time between STOP and START conditions, 100 kbps         |      | 4700 |      | ns      |
| $t_{TWIS,BUF,400kbps}$     | TWI slave bus free time between STOP and START conditions, 400 kbps         |      | 1300 |      | ns      |

Figure 171: TWIS timing diagram, 1 byte transaction

## 6.31 UART — Universal asynchronous receiver/transmitter

<sup>38</sup> High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see [GPIO](#) chapter for more details.

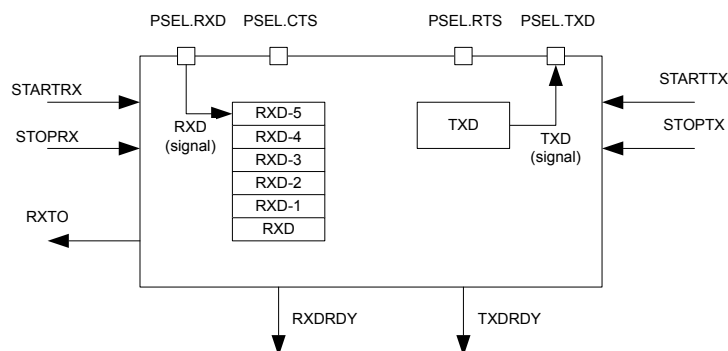

Figure 172: UART configuration

### 6.31.1 Functional description

Listed here are the main features of UART.

The UART implements support for the following features:

- Full-duplex operation
- Automatic flow control
- Parity checking and generation for the 9<sup>th</sup> data bit

As illustrated in [UART configuration](#) on page 483, the UART uses the TXD and RXD registers directly to transmit and receive data. The UART uses one stop bit.

**Note:** The external crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 80 for more information.

### 6.31.2 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with the UART are mapped to physical pins according to the configuration specified in the PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers respectively.

If the CONNECT field of a PSEL.xxx register is set to Disconnected, the associated UART signal will not be connected to any physical pin. The PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers and their configurations are only used as long as the UART is enabled, and retained only for the duration the device is in ON mode. PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD must only be configured when the UART is disabled.

To secure correct signal levels on the pins by the UART when the system is in OFF mode, the pins must be configured in the GPIO peripheral as described in [Pin configuration](#) on page 483.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| UART pin | Direction | Output value   |
|----------|-----------|----------------|
| RXD      | Input     | Not applicable |
| CTS      | Input     | Not applicable |
| RTS      | Output    | 1              |
| TXD      | Output    | 1              |

Table 126: GPIO configuration

### 6.31.3 Shared resources

The UART shares registers and resources with other peripherals that have the same ID as the UART.

All peripherals with the same ID as the UART must be disabled before configuring and using the UART. Disabling a peripheral that has the same ID as the UART will not reset any of the registers that are shared with the UART. It is therefore important to configure all relevant UART registers explicitly to ensure that it operates correctly.

See [Instantiation](#) on page 22 for details on peripherals and their IDs.

### 6.31.4 Transmission

A UART transmission sequence is started by triggering the STARTTX task.

Bytes are transmitted by writing to the TXD register. When a byte has been successfully transmitted, the UART will generate a TXDRDY event after which a new byte can be written to the TXD register. A UART transmission sequence is stopped immediately by triggering the STOPTX task.

If flow control is enabled, a transmission will be automatically suspended when CTS is deactivated, and resumed when CTS is activated again, as shown in the following figure. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended. For more information, see [Suspending the UART](#) on page 485.

Figure 173: UART transmission

### 6.31.5 Reception

A UART reception sequence is started by triggering the STARTRX task.

The UART receiver chain implements a FIFO capable of storing six incoming RXD bytes before data is overwritten. Bytes are extracted from this FIFO by reading the RXD register. When a byte is extracted from the FIFO, a new byte pending in the FIFO will be moved to the RXD register. The UART will generate an RXDRDY event every time a new byte is moved to the RXD register.

When flow control is enabled, the UART will deactivate the RTS signal when there is only space for four more bytes in the receiver FIFO. The counterpart transmitter is therefore able to send up to four bytes after the RTS signal is deactivated before data is being overwritten. To prevent overwriting data in the FIFO, the counterpart UART transmitter must therefore make sure to stop transmitting data within four bytes after the RTS line is deactivated.

The RTS signal will first be activated again when the FIFO has been emptied, that is, when all bytes in the FIFO have been read by the CPU, see [UART reception](#) on page 485.

The RTS signal will also be deactivated when the receiver is stopped through the STOPRX task as illustrated in [UART reception](#) on page 485. The UART is able to receive four to five additional bytes if they are sent in succession immediately after the RTS signal has been deactivated. This is possible because the UART is, even after the STOPRX task is triggered, able to receive bytes for an extended period of time dependent on the configured baud rate. The UART will generate a receiver timeout event (RXTO) when this period has elapsed.

To prevent loss of incoming data, the RXD register must only be read one time following every RXDRDY event.

To secure that the CPU can detect all incoming RXDRDY events through the RXDRDY event register, the RXDRDY event register must be cleared before the RXD register is read. The reason for this is that the UART is allowed to write a new byte to the RXD register, and can generate a new event immediately after the RXD register is read (emptied) by the CPU.

Figure 174: UART reception

As indicated in occurrence 2 in the figure, the RXDRDY event associated with byte B is generated first after byte A has been extracted from RXD.

### 6.31.6 Suspending the UART

The UART can be suspended by triggering the SUSPEND task.

SUSPEND will affect both the UART receiver and the UART transmitter, i.e. the transmitter will stop transmitting and the receiver will stop receiving. UART transmission and reception can be resumed, after being suspended, by triggering STARTTX and STARTRX respectively.

Following a SUSPEND task, an ongoing TXD byte transmission will be completed before the UART is suspended.

When the SUSPEND task is triggered, the UART receiver will behave in the same way as it does when the STOPRX task is triggered.

### 6.31.7 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

### 6.31.8 Using the UART without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

### 6.31.9 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register **CONFIG** on page 494. If odd parity is desired, it can be configured using the register **CONFIG** on page 494. See the register description for details.

The amount of stop bits can also be configured through the register **CONFIG** on page 494.

### 6.31.10 Registers

| Base address | Peripheral | Instance | Description                                 | Configuration |
|--------------|------------|----------|---|---------------|
| 0x40002000   | UART       | UART0    | Universal asynchronous receiver/transmitter | Deprecated    |

Table 127: Instances

| Register      | Offset | Description   |
|---------------|--------|---|
| TASKS_STARTRX | 0x000  | Start UART receiver                                       |
| TASKS_STOPRX  | 0x004  | Stop UART receiver  |
| TASKS_STARTTX | 0x008  | Start UART transmitter                                    |
| TASKS_STOPTX  | 0x00C  | Stop UART transmitter                                     |
| TASKS_SUSPEND | 0x01C  | Suspend UART  |
| EVENTS_CTS    | 0x100  | CTS is activated (set low). Clear To Send.                |
| EVENTS_NCTS   | 0x104  | CTS is deactivated (set high). Not Clear To Send.         |
| EVENTS_RXDRDY | 0x108  | Data received in RXD                                      |
| EVENTS_TXDRDY | 0x11C  | Data sent from TXD  |
| EVENTS_ERROR  | 0x124  | Error detected  |
| EVENTS_RXT0   | 0x144  | Receiver timeout  |
| SHORTS        | 0x200  | Shortcuts between local events and tasks                  |
| INTENSET      | 0x304  | Enable interrupt  |
| INTENCLR      | 0x308  | Disable interrupt   |
| ERRORSRC      | 0x480  | Error source  |
| ENABLE        | 0x500  | Enable UART   |
| PSEL.RTS      | 0x508  | Pin select for RTS  |
| PSEL.TXD      | 0x50C  | Pin select for TXD  |

## 6.31.11 Electrical specification

### 6.31.11.1 UART electrical specification

| Symbol                  | Description  | Min. | Typ. | Max. | Units         |
|-------------------------|--|------|------|------|---------------|
| $f_{\text{UART}}$       | Baud rate for UART <sup>39</sup> .                     |      |      | 1000 | kbps          |
| $t_{\text{UART,CTSH}}$  | CTS high time  | 1    |      |      | $\mu\text{s}$ |
| $t_{\text{UART,START}}$ | Time from STARTRX/STARTTX task to transmission started |      | 1    |      | $\mu\text{s}$ |

## 6.32 UARTE — Universal asynchronous receiver/transmitter with EasyDMA

The Universal asynchronous receiver/transmitter with EasyDMA (UARTE) offers fast, full-duplex, asynchronous serial communication with built-in flow control (CTS, RTS) support in hardware at a rate up to 1 Mbps, and EasyDMA data transfer from/to RAM.

Listed here are the main features for UARTE:

- Full-duplex operation
- Automatic hardware flow control
- Optional even parity bit checking and generation
- EasyDMA
- Up to 1 Mbps baudrate
- Return to IDLE between transactions supported (when using HW flow control)
- One or two stop bit
- Least significant bit (LSB) first

Figure 175: UARTE configuration

The GPIOs used for each UART interface can be chosen from any GPIO on the device and are independently configurable. This enables great flexibility in device pinout and efficient use of board space and signal routing.

**Note:** The external crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 80 for more information.

<sup>39</sup> High baud rates may require GPIOs to be set as High Drive, see [GPIO](#) for more details.

### 6.32.1 EasyDMA

The UARTE implements EasyDMA for reading and writing to and from the RAM.

If the TXD.PTR and the RXD.PTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 19 for more information about the different memory regions.

The .PTR and .MAXCNT registers are double-buffered. They can be updated and prepared for the next RX/TX transmission immediately after having received the RXSTARTED/TXSTARTED event.

The ENDRX and ENDTX events indicate that the EasyDMA is finished accessing the RX or TX buffer in RAM.

### 6.32.2 Transmission

The first step of a DMA transmission is storing bytes in the transmit buffer and configuring EasyDMA. This is achieved by writing the initial address pointer to TXD.PTR, and the number of bytes in the RAM buffer to TXD.MAXCNT. The UARTE transmission is started by triggering the STARTTX task.

After each byte has been sent over the TXD line, a TXDRDY event will be generated.

When all bytes in the TXD buffer, as specified in the TXD.MAXCNT register, have been transmitted, the UARTE transmission will end automatically and an ENDTX event will be generated.

A UARTE transmission sequence is stopped by triggering the STOPTX task. A TXSTOPPED event will be generated when the UARTE transmitter has stopped.

If the ENDTX event has not already been generated when the UARTE transmitter has come to a stop, the UARTE will generate the ENDTX event explicitly even though all bytes in the TXD buffer, as specified in the TXD.MAXCNT register, have not been transmitted.

If flow control is enabled through the HWFC field in the CONFIG register, a transmission will be automatically suspended when CTS is deactivated and resumed when CTS is activated again, as shown in the following figure. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended.

Figure 176: UARTE transmission

The UARTE transmitter will be in its lowest activity level, and consume the least amount of energy, when it is stopped, i.e. before it is started via STARTTX or after it has been stopped via STOPTX and the TXSTOPPED

event has been generated. See [POWER — Power supply](#) on page 58 for more information about power modes.

### 6.32.3 Reception

The UARTE receiver is started by triggering the STARTRX task. The UARTE receiver is using EasyDMA to store incoming data in an RX buffer in RAM.

The RX buffer is located at the address specified in the RXD.PTR register. The RXD.PTR register is double-buffered and it can be updated and prepared for the next STARTRX task immediately after the RXSTARTED event is generated. The size of the RX buffer is specified in the RXD.MAXCNT register. The UARTE generates an ENDRX event when it has filled up the RX buffer, as seen in the following figure.

For each byte received over the RXD line, an RXDRDY event will be generated. This event is likely to occur before the corresponding data has been transferred to Data RAM.

The RXD.AMOUNT register can be queried following an ENDRX event to see how many new bytes have been transferred to the RX buffer in RAM since the previous ENDRX event.

Figure 177: UARTE reception

The UARTE receiver is stopped by triggering the STOPRX task. An RXTO event is generated when the UARTE has stopped. The UARTE will make sure that an impending ENDRX event will be generated before the RXTO event is generated. This means that the UARTE will guarantee that no ENDRX event will be generated after RXTO, unless the UARTE is restarted or a FLUSHRX command is issued after the RXTO event is generated.

**Note:** If the ENDRX event has not been generated when the UARTE receiver stops, indicating that all pending content in the RX FIFO has been moved to the RX buffer, the UARTE will generate the ENDRX event explicitly even though the RX buffer is not full. In this scenario the ENDRX event will be generated before the RXTO event is generated.

To determine the amount of bytes the RX buffer has received, the CPU can read the RXD.AMOUNT register following the ENDRX event or the RXTO event.

The UARTe is able to receive up to four bytes after the STOPRX task has been triggered, as long as these are sent in succession immediately after the RTS signal is deactivated. After the RTS is deactivated, the UART is able to receive bytes for a period of time equal to the time needed to send four bytes on the configured baud rate.

After the RXT0 event is generated the internal RX FIFO may still contain data, and to move this data to RAM the FLUSHRX task must be triggered. To make sure that this data does not overwrite data in the RX buffer, the RX buffer should be emptied or the RXD.PTR should be updated before the FLUSHRX task is triggered. To make sure that all data in the RX FIFO is moved to the RX buffer, the RXD.MAXCNT register must be set to  $RXD.MAXCNT > 4$ , as seen in the following figure. The UARTe will generate the ENDRX event after completing the FLUSHRX task even if the RX FIFO was empty or if the RX buffer does not get filled up. To be able to know how many bytes have actually been received into the RX buffer in this case, the CPU can read the RXD.AMOUNT register following the ENDRX event.

Figure 178: UARTe reception with forced stop via STOPRX

If HW flow control is enabled through the HWFC field in the CONFIG register, the RTS signal will be deactivated when the receiver is stopped via the STOPRX task or when the UARTe is only able to receive four more bytes in its internal RX FIFO.

With flow control disabled, the UARTe will function in the same way as when the flow control is enabled except that the RTS line will not be used. This means that no signal will be generated when the UARTe has reached the point where it is only able to receive four more bytes in its internal RX FIFO. Data received when the internal RX FIFO is filled up, will be lost.

The UARTe receiver will be in its lowest activity level, and consume the least amount of energy, when it is stopped, i.e. before it is started via STARTRX or after it has been stopped via STOPRX and the RXT0 event has been generated. See [POWER — Power supply](#) on page 58 for more information about power modes.

### 6.32.4 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

An ERROR event will not stop reception. If the error was a parity error, the received byte will still be transferred into Data RAM, and so will following incoming bytes. If there was a framing error (wrong stop bit), that specific byte will NOT be stored into Data RAM, but following incoming bytes will.

### 6.32.5 Using the UARTe without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

### 6.32.6 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register **CONFIG** on page 512. If odd parity is desired, it can be configured using the register **CONFIG** on page 512. See the register description for details.

The amount of stop bits can also be configured through the register **CONFIG** on page 512.

### 6.32.7 Low power

When putting the system in low power and the peripheral is not needed, lowest possible power consumption is achieved by stopping, and then disabling the peripheral.

The STOPTX and STOPRX tasks may not be always needed (the peripheral might already be stopped), but if STOPTX and/or STOPRX is sent, software shall wait until the TXSTOPPED and/or RXTO event is received in response, before disabling the peripheral through the ENABLE register.

### 6.32.8 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with the UARTE are mapped to physical pins according to the configuration specified in the PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers respectively.

The PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers and their configurations are only used as long as the UARTE is enabled, and retained only for the duration the device is in ON mode. PSEL.RXD, PSEL.RTS, PSEL.RTS, and PSEL.TXD must only be configured when the UARTE is disabled.

To secure correct signal levels on the pins by the UARTE when the system is in OFF mode, the pins must be configured in the GPIO peripheral as described in the following table.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| UARTE signal | UARTE pin                | Direction | Output value   |
|--------------|--------------------------|-----------|----------------|
| RXD          | As specified in PSEL.RXD | Input     | Not applicable |
| CTS          | As specified in PSEL.CTS | Input     | Not applicable |
| RTS          | As specified in PSEL.RTS | Output    | 1              |
| TXD          | As specified in PSEL.TXD | Output    | 1              |

Table 129: GPIO configuration before enabling peripheral

### 6.32.9 Registers

| Base address | Peripheral | Instance | Description  | Configuration |
|--------------|------------|----------|--|---------------|
| 0x40002000   | UARTE      | UARTE0   | Universal asynchronous receiver/transmitter with EasyDMA, unit 0 |               |
| 0x40028000   | UARTE      | UARTE1   | Universal asynchronous receiver/transmitter with EasyDMA, unit 1 |               |

Table 130: Instances

| Register      | Offset | Description                  |
|---------------|--------|------------------------------|
| TASKS_STARTRX | 0x000  | Start UART receiver          |
| TASKS_STOPRX  | 0x004  | Stop UART receiver           |
| TASKS_STARTTX | 0x008  | Start UART transmitter       |
| TASKS_STOPTX  | 0x00C  | Stop UART transmitter        |
| TASKS_FLUSHRX | 0x02C  | Flush RX FIFO into RX buffer |

| Register         | Offset | Description  |
|------------------|--------|--|
| EVENTS_CTS       | 0x100  | CTS is activated (set low). Clear To Send.                             |
| EVENTS_NCTS      | 0x104  | CTS is deactivated (set high). Not Clear To Send.                      |
| EVENTS_RXDRDY    | 0x108  | Data received in RXD (but potentially not yet transferred to Data RAM) |
| EVENTS_ENDRX     | 0x110  | Receive buffer is filled up  |
| EVENTS_TXDRDY    | 0x11C  | Data sent from TXD   |
| EVENTS_ENDTX     | 0x120  | Last TX byte transmitted   |
| EVENTS_ERROR     | 0x124  | Error detected   |
| EVENTS_RXTO      | 0x144  | Receiver timeout   |
| EVENTS_RXSTARTED | 0x14C  | UART receiver has started  |
| EVENTS_TXSTARTED | 0x150  | UART transmitter has started   |
| EVENTS_TXSTOPPED | 0x158  | Transmitter stopped  |
| SHORTS           | 0x200  | Shortcuts between local events and tasks                               |
| INTEN            | 0x300  | Enable or disable interrupt  |
| INTENSET         | 0x304  | Enable interrupt   |
| INTENCLR         | 0x308  | Disable interrupt  |
| ERRORSRC         | 0x480  | Error source   |
|                  |        | This register is read/write one to clear.                              |
| ENABLE           | 0x500  | Enable UART  |
| PSEL.RTS         | 0x508  | Pin select for RTS signal  |
| PSEL.TXD         | 0x50C  | Pin select for TXD signal  |
| PSEL.CTS         | 0x510  | Pin select for CTS signal  |
| PSEL.RXD         | 0x514  | Pin select for RXD signal  |
| BAUDRATE         | 0x524  | Baud rate. Accuracy depends on the HFCLK source selected.              |
| RXD.PTR          | 0x534  | Data pointer   |
| RXD.MAXCNT       | 0x538  | Maximum number of bytes in receive buffer                              |
| RXD.AMOUNT       | 0x53C  | Number of bytes transferred in the last transaction                    |
| TXD.PTR          | 0x544  | Data pointer   |
| TXD.MAXCNT       | 0x548  | Maximum number of bytes in transmit buffer                             |
| TXD.AMOUNT       | 0x54C  | Number of bytes transferred in the last transaction                    |
| CONFIG           | 0x56C  | Configuration of parity and hardware flow control                      |

## 6.32.10 Electrical specification

### 6.32.10.1 UARTE electrical specification

| Symbol            | Description  | Min. | Typ. | Max. | Units   |
|-------------------|--|------|------|------|---------|
| $f_{UARTE}$       | Baud rate for UARTE <sup>40</sup> .                    |      |      | 1000 | kbps    |
| $t_{UARTE,CTSH}$  | CTS high time  | 1    |      |      | $\mu$ s |
| $t_{UARTE,START}$ | Time from STARTRX/STARTTX task to transmission started |      | 1    |      | $\mu$ s |

## 6.33 USB — Universal serial bus device

The USB device (USB) controller implements a full speed USB device function that meets 2.0 revision of the USB specification.

<sup>40</sup> High baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Figure 179: USB device block diagram

Listed here are the main features for USB D:

- Implements full-speed (12 Mbps) device fully compliant to [Universal Serial Bus Specification Revision 2.0](#), including following engineering change notices (ECNs) issued by USB Implementers Forum:
  - *Pull-up/pull-down Resistors ECN*
  - *5V Short Circuit Withstand Requirement Change ECN*
- USB device stack available in the Nordic SDK
- Integrated (on-chip) USB transceiver (PHY)
- Software controlled on-chip pull-up on D+
- Endpoints:
  - 2 control (1 IN, 1 OUT)
  - 14 bulk/interrupt (7 IN, 7 OUT)
  - 2 isochronous (1 IN, 1 OUT)
- Supports double buffering for isochronous (ISO) endpoints (IN/OUT)
- Supports USB suspend, resume, and remote wake-up
- 64 bytes buffer size for each bulk/interrupt endpoint
- Up to 1023 bytes buffer size for ISO endpoints
- EasyDMA for all data transfers

### 6.33.1 USB device states

The behavior of a USB device can be modelled through a state diagram.

The USB specification revision 2.0 (see *Chapter 9 USB Device Framework*) defines a number of states for a USB device, as illustrated below.

Figure 180: Device state diagram

The device must change state according to host-initiated traffic and USB bus states. It is up to the software to implement a state machine that matches the above definition. To detect the presence or absence of USB supply (VBUS), the **POWER** chapter defines two events, USBDETECTED and USBREMOVED, which can be used to implement the state machine.

As a general rule when implementing the software, the host behavior shall never be assumed to be predictable. In particular the sequence of commands received during an enumeration. The software shall always react to the current bus conditions or commands sent by the host.

### 6.33.2 USB terminology

The USB specification defines bus states, rather than logic levels on the D+ and D- lines.

For a full speed device, the bus state where the D+ line is high and the D- line is low is defined as the J state. The bus state where D+ is low and D- high is called the K state.

An idle bus, where D+ and D- lines are only polarized through the pull-up on D+ and pull-downs on the host side, will be in J state.

Both lines low are called SE0 (single-ended 0), and both lines high SE1 (single-ended 1).

### 6.33.3 USB pins

The USB peripheral features a number of dedicated pins.

The dedicated USB pins can be grouped in two categories, signal and power. The signal pins consist of the D+ and D- pins, which are to be connected to the USB host. They are dedicated pins, and not available as standard GPIOs. The USBD implements the *5V Short Circuit Withstand ECN* meaning that these two pins are not 5 V tolerant.

The signal pins and the pull-up will operate only while VBUS is in its valid voltage range, and USBD is enabled through the **ENABLE** register. For details on the USB power supply and VBUS detection, see **POWER**.

See **Pin assignments** on page 557 for more information about the pinout.

### 6.33.4 USBD power-up sequence

The physical layer interface (PHY)/USB transceiver is powered separately from the rest of the device (VBUS pin), which has some implications on the USBD power-up sequence.

The device is not able to properly signal its presence to the USB host and handle traffic from the host, unless the PHY's power supply is enabled and stable. Turning the PHY's power supply on/off is directly linked to register **ENABLE**. The device provides events that help synchronizing software to the various steps during the power-up sequence.

To make sure that all resources in USBD are available and the dedicated USB voltage regulator stabilized, the following is recommended:

- Enable USBD after VBUS has been detected only
- Turn the USB pull-up on after:
  - USBPWRRDY event has occurred
  - USBEVENT has occurred, with the READY condition flagged in **EVENTCAUSE**

The following sequence chart illustrates a typical handling of VBUS power-up:

Figure 181: VBUS power-up sequence

Upon VBUS removal detection, signalled by the USBREMOVED event described in **POWER**, it is recommended to let on-going EasyDMA transfers finish (wait for the relevant ENDEPIN[n], ENDISOIN, ENDEPOT[n] or ENDISOOUT event, see **EasyDMA** on page 518), before disabling USBD (by writing **ENABLE=Disabled**). Reading the **ENABLE** register will return Enabled until USBD is completely disabled.

### 6.33.5 USB pull-up

The USB pull-up serves two purposes - it indicates to the host that the device is connected to the USB bus, and it indicates the device's speed capability.

When no pull-up is connected to the USB bus, the host sees both D+ and D- lines low, as they are pulled down on the host side by 15 k $\Omega$  resistors. The device is not seen by the host and hence in detached state, even though it could be physically connected to the host. USB specification does not allow to draw any current on VBUS in that situation.

When a full-speed device connects its 1.5 k $\Omega$  pull-up to D+, the host sees the corresponding line high. The device is then in the attached state. During the enumeration process, the host attempts to determine if the full-speed device also supports higher speeds and initiates communication with the device to further identify it. The USB peripheral implemented in this device supports only full-speed (12 Mbps), and thus ignores the negotiation for higher speeds in accordance with the USB specification revision 2.0.

Register `USBPULLUP` provides means to connect or disconnect the pull-up on D+ under software control. This allows the software to control when USB enumeration takes place. It also allows to emulate a physical disconnect from the USB bus, for instance when re-enumeration is required. `USBPULLUP` has to be enabled to allow the USB peripheral to handle USB traffic and generate appropriate events. This forbids the use of an external pull-up.

Note that disconnecting the pull-up through register `USBPULLUP` while connected to a host, will result in both D+ and D- lines to be pulled low by the host's pull-down resistors. However, as mentioned above, this will also inhibit the generation of the USBRESET event. The pull-up is disabled by default after a chip reset.

The pull-up shall only get connected after USB peripheral has been enabled through register `ENABLE`. The USB pull-up value is automatically changed depending on the bus activity, as specified in *Resistor ECN* which amends the original USB specification version 2.0. The user does not have access to this function, it is handled in hardware.

While they should never be used in normal traffic activity, lines D+ and D- may at any time be forced into state specified in register `DPDMVALUE` by the task `DPDMDRIVE`. The `DPDMNODRIVE` task stops driving them, and PHY returns to normal operation.

### 6.33.6 USB reset

The USB specification defines a USB reset, which is not to be confused with a chip reset. The USB reset is a normal USB bus condition, and is used as part of the enumeration sequence, it does not reset the chip.

The USB reset results from a single-ended low state (SE0) on lines D+/D- for a  $t_{\text{USB,DETRST}}$  amount of time. Only the host is allowed to drive a USB reset condition on the bus. The USB peripheral automatically interprets a SE0 longer than  $t_{\text{USB,DETRST}}$  as a USB reset. When the device detects a USB reset and generates a USBRESET event, the device USB stack and related parts of the application shall re-initialize themselves, and go back to the default state.

Some of the registers in the USB peripheral get automatically reset to a known state, in particular all data endpoints are disabled and the `USBADDR` reset to 0.

After the device has connected to the USB bus (i.e. after VBUS is applied), the device shall not respond to any traffic from the time the pull-up is enabled until it has seen a USB reset condition. This is automatically ensured by the USB peripheral.

After a USB reset, the device shall be fully responsive after at most  $T_{\text{RSTRCY}}$  (according to chapter 7 in the USB specification). Software shall take into account this time that takes the hardware to recover from a USB reset condition.

### 6.33.7 USB suspend and resume

Normally, the host will maintain activity on the USB at least every millisecond according to USB specification. A USB device will enter suspend when there is no activity on the bus (idle) for a given time. The device will resume operation when it receives any non idle signalling.

To signal that the device shall go into low power mode (suspend), the host stops activity on the USB bus, which becomes idle. Only the device pull-up and host pull-downs act on D+ and D-, and the bus is thus kept at a constant J state. It is up to the device to detect this lack of activity, and enter the low power mode (suspend) within a specified time.

The USB host can decide to suspend or resume USB activity at any time. If remote wake-up is enabled, the device may signal to the host to resume from suspend.

#### 6.33.7.1 Entering suspend

The USB peripheral automatically detects lack of activity for more than a defined amount of time, and performs steps needed to enter suspend.

When no activity has been detected for longer than  $t_{\text{USB,SUSPEND}}$ , the USB peripheral generates the USBEVENT event with SUSPEND bit set in register `EVENTCAUSE`. The software shall ensure that the current drawn from the USB supply line VBUS is within the specified limits before  $T_{2\text{SUSP}}$ , as defined in chapter 7 of the USB specification. In order to reduce idle current of USB peripheral, the software must explicitly place the USB peripheral in low power mode through writing `LowPower` to register `LOWPOWER`.

In order to save power, and provided that no other peripheral needs it, the crystal oscillator (HFXO) in CLOCK may be disabled by software during the USB suspend, while the USB pull-up is disconnected, or when VBUS is not present. Software must explicitly enable it at any other time. The USB peripheral will not be able to respond to USB traffic unless HFXO is enabled and stable.

#### 6.33.7.2 Host-initiated resume

Once the host resumes the bus activity, it has to be responsive to incoming requests on the USB bus within the time  $T_{\text{RSMRCY}}$  (as defined in chapter 7 of the USB specification) and revert to normal power consumption mode.

If the host resumes bus activity with or without a RESUME condition (in other words: bus activity is defined as any non-J state), the USB peripheral will generate a USBEVENT event, with RESUME bit set in register `EVENTCAUSE`. If the host resumes bus activity simply by restarting sending frames, the USB peripheral will generate SOF events.

#### 6.33.7.3 Device-initiated remote wake-up

Assuming the remote wake-up is supported by the device and enabled by the host, the device can request the host to resume from suspend if wake-up condition is met.

To do so, the HFXO needs to be enabled first. After waking up the HFXO, the software must bring USB peripheral out of the low power mode and into the normal power consumption mode through writing `ForceNormal` in register `LOWPOWER`. It can then instruct the USB peripheral to drive a RESUME condition (K state) on the USB bus by triggering the DPDMDRIVE task, and hence attempt to wake up the host. By choosing `Resume` in `DPDMVALUE`, the duration of the RESUME state is under hardware control ( $t_{\text{USB,DRIVEK}}$ ). By choosing `J` or `K`, the duration of that state is under software control (the J or K state is maintained until a DPDMNODRIVE task is triggered) and has to meet  $T_{\text{DRSMUP}}$  as specified in USB specification chapter 7.

Upon writing the `ForceNormal` in register `LOWPOWER`, a USBEVENT event is generated with the USBWUALLOWED bit set in register `EVENTCAUSE`.

The value in register `DPDMVALUE` on page 546 will only be captured and used when the DPDMDRIVE task is triggered. This value defines the state the bus will be forced into after the DPDMDRIVE task.

Note that the device shall ensure that it does not initiate a remote wake-up request before  $T_{\text{WTRSM}}$  (according to USB specification chapter 7) after the bus has entered idle state. Using the recommended

resume value in [DPDMVALUE](#) (rather than K) takes care of this, and postpones the RESUME state accordingly.

### 6.33.8 EasyDMA

The USB peripheral implements EasyDMA for accessing memory without CPU involvement.

Each endpoint has an associated set of registers, tasks and events. EasyDMA and traffic on USB are tightly related. A number of events provide insight of what is happening on the USB bus, and a number of tasks allow to somewhat automate response to the traffic.

**Note:** Endpoint 0 (IN and OUT) are implemented as control endpoint. For more information, see [Control transfers](#) on page 519.

## Registers

Enabling endpoints is controlled through the [EPINEN](#) and [EPOUTEN](#) registers.

The following registers define the memory address of the buffer for a specific IN or OUT endpoint:

- [EPIN\[n\].PTR](#), (n=0..7)
- [EPOUT\[n\].PTR](#), (n=0..7)
- [ISOIN.PTR](#)
- [ISOOUT.PTR](#)

The following registers define the amount of bytes to be sent on USB for next transaction:

- [EPIN\[n\].MAXCNT](#), (n=0..7)
- [ISOIN.MAXCNT](#)

The following registers define the length of the buffer (in bytes) for next transfer of incoming data:

- [EPOUT\[n\].MAXCNT](#), (n=1..7)
- [ISOOUT.MAXCNT](#)

Since the host decides how many bytes are sent over USB, the MAXCNT value can be copied from register [SIZE.EPOUT\[n\]](#) (n=1..7) or register [SIZE.ISOOUT](#).

Register [EPOUT\[0\].MAXCNT](#) defines the length of the OUT buffer (in bytes) for the control endpoint 0. If the USB host does not misbehave, register [SIZE.EPOUT\[0\]](#) will indicate the same value as `MaxPacketSize` from the device descriptor or `wLength` from the SETUP command, whichever the smallest.

The [.AMOUNT](#) registers indicate how many bytes actually have been transferred over EasyDMA during the last transfer.

Stalling bulk/interrupt endpoints is controlled through the [EPSTALL](#) register.

**Note:** Due to USB specification requirements, the effect of the stalling control endpoint 0 may be overridden by hardware, in particular when a new SETUP token is received.

EasyDMA will not copy the SETUP data to memory (it will only transfer data from the data stage). Setup data is available as separate registers in the USB peripheral:

- [BMREQUESTTYPE](#)
- [BREQUEST](#)
- [WVALUEL](#)
- [WVALUEH](#)
- [WINDEXL](#)
- [WINDEXH](#)

- [WLENGTHL](#)
- [WLENGTHH](#)

[EVENTCAUSE](#) register provides details on what caused a given USBEVENT event, for instance if a CRC error is detected during a transaction, or if bus activity stops or resumes.

## Tasks

Tasks [STARTEPIN\[n\]](#), [STARTEPOUT\[n\]](#) (n=0..7), [STARTISOIN](#) and [STARTISOOUT](#) capture the values for [.PTR](#) and [.MAXCNT](#) registers. For IN endpoints, a transaction over USB gets automatically triggered when the EasyDMA transfer is complete. For OUT endpoints, it is up to software to allow the next transaction over USB. See the examples in [Control transfers](#) on page 519, [Bulk and interrupt transactions](#) on page 522 and [Isochronous transactions](#) on page 525.

For the control endpoint 0, OUT transactions are allowed through the [EPORCVOUT](#) task. The [EPOSTATUS](#) task allows a status stage to be initiated, and the [EPOSTALL](#) task allows stalling further traffic (data or status stage) on the control endpoint.

## Events

The [STARTED](#) event confirms that the values of the [.PTR](#) and [.MAXCNT](#) registers of the endpoints flagged in register [EPSTATUS](#) have been captured. Those can then be modified by software for the next transfer.

Events [ENDEPIN\[n\]](#), [ENDEPOUT\[n\]](#) (n=0..7), [ENDISOIN](#) and [ENDISOOUT](#) events indicate that the whole buffer has been consumed. The buffer can be accessed safely by the software.

Only a single EasyDMA transfer can take place in USB at any time. Software must ensure that tasks [STARTEPIN\[n\]](#) (n=0..7), [STARTISOIN](#), [STARTEPOUT\[n\]](#) (n=0..7) or [STARTISOOUT](#) are not triggered before events [ENDEPIN\[n\]](#) (n=0..7), [ENDISOIN](#), [ENDEPOUT\[n\]](#) (n=0..7) or [ENDISOOUT](#) are received from an on-going transfer.

The [EPDATA](#) event indicates that a successful (acknowledged) data transaction has occurred on the data endpoint(s) flagged in register [EPDATASTATUS](#). A successful (acknowledged) data transaction on endpoint 0 is signalled by the [EPODATADONE](#) event.

At any time a [USBEVENT](#) event may be sent, with details provided in [EVENTCAUSE](#) register.

[EPOSETUP](#) event indicates that a SETUP token has been received on the control endpoint 0, and that the setup data is available in [registers](#).

### 6.33.9 Control transfers

The USB specification mandates every USB device to implement endpoint 0 IN and OUT as control endpoints.

A control transfer consists of two or three stages:

- Setup stage
- Data stage (optional)
- Status stage

Each control transfer can be one of following types:

- Control read
- Control read no data
- Control write
- Control write no data

An [EPOSETUP](#) event indicates that the data in the setup stage (following the SETUP token) is available in [registers](#).

The data in the data stage (following the IN or OUT token) is transferred from or to the desired location using EasyDMA.

The control endpoint buffer can be of any size.

After receiving the SETUP token, the USB controller will not accept (NAK) any incoming IN or OUT tokens until the software has finished decoding the command, determining the type of transfer, and preparing for the next stage (data or status) appropriately.

The software can choose to stall a command (in both data and status stages) through the EPOSTALL task, for instance if the command is not supported, or its wValue, wIndex or wLength parameters are wrong. A stalled control read transfer is illustrated below, but the same mechanism (same tasks) applies to stalling a control write transfer (not illustrated):

Figure 182: Control read gets stalled

See chapter 9 of the USB specification and relevant class specifications for rules on when to stall a command.

**Note:** The USB peripheral handles the SetAddress transfer by itself. As a consequence, the software shall not process this command other than updating its state machine (see [Device state diagram](#)), nor initiate a status stage. If necessary, the address assigned by the host can be read out from the USBADDR register after the command has been processed.

### 6.33.9.1 Control read transfer

This section describes how the software behaves to respond to a control read transfer.

As mentioned earlier, the USB controller will not accept (NAK) any incoming IN tokens until software has finished decoding the command, determining the type of transfer, and preparing for the next stage (data or status) appropriately.

For a control read, transferring the data from memory into USBD will trigger a valid, acknowledged (ACK) IN transaction on USB.

The software has to prepare EasyDMA by pointing to the buffer containing the data to be transferred. If no other EasyDMA transfers are on-going with USBD, the software can send the STARTEPIN0 task, which will initiate the data transfer and transaction on USB.

A STARTED event (with EPIN0 bit set in the EPSTATUS register) will be generated as soon as the EPIN[0].PTR and .MAXCNT registers have been captured. Software may then prepare them for the next data transaction.

An ENDEPIN[0] event will be generated when the data has been transferred from memory to the USB peripheral.

Finally, an EPODATADONE event will be generated when the data has been transmitted over USB and acknowledged by the host.

The software can then either prepare and transmit the next data transaction by repeating the above sequence, or initiate the status stage through the EPOSTATUS task.

Figure 183: Control read transfer

Note the possibility to enable a shortcut from the EPODATADONE event to the EPOSTATUS task, typically if the data stage is expected to take a single transfer. If there is no data stage, the software can initiate the status stage through the EPOSTATUS task right away, as illustrated below:

Figure 184: Control read no data transfer

### 6.33.9.2 Control write transfer

This section describes how the software responds to a control write transfer.

The software has to prepare EasyDMA by pointing to the buffer in memory that shall contain the incoming data. If no other EasyDMA transfers are on-going with USB, the software can then send the EPORCVOUT task, which will make USB acknowledge (ACK) the first OUT+DATA transaction from the host.

An EPODATADONE event will be generated when a new OUT+DATA has been transmitted over USB, and is about to get acknowledged by the device.

A STARTED event (with EPOUT0 bit set in the EPSTATUS register) will be generated as soon as the EPOUT[0].PTR and .MAXCNT registers have been captured, after receiving the first transaction. Software may then prepare them for the next data transaction.

An ENDEPOUT[0] event will be generated when the data has been transferred from the USB peripheral to memory. The software can then either prepare to receive the next data transaction by repeating the above sequence, or initiate the status stage through the EPOSTATUS task. Until then, further incoming OUT+DATA transactions get a NAK response by the device.

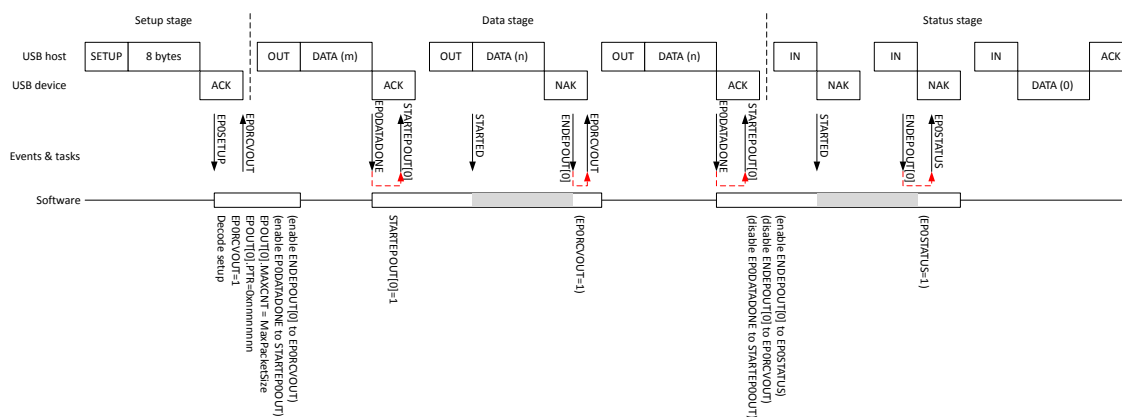

Figure 185: Control write transfer

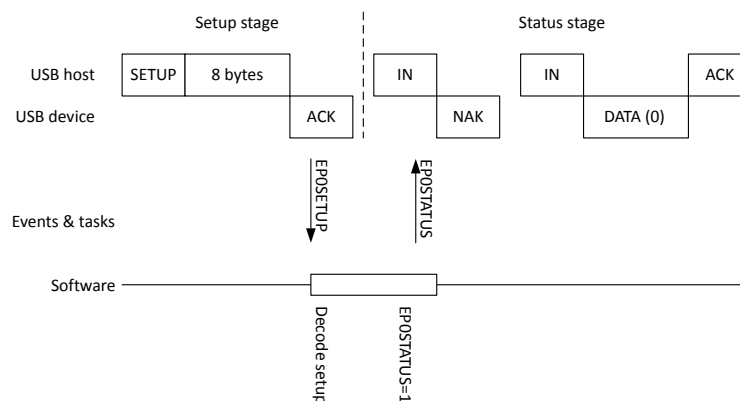

Figure 186: Control write no data transfer

### 6.33.10 Bulk and interrupt transactions

The USB peripheral implements seven pairs of bulk/interrupt endpoints.

The bulk/interrupt endpoints have a fixed USB endpoint number, summarized in the table below.

| Bulk endpoint # | USB IN endpoint | USB OUT endpoint |
|-----------------|-----------------|------------------|
| [1]             | 0x81            | 0x01             |
| [2]             | 0x82            | 0x02             |
| [3]             | 0x83            | 0x03             |
| [4]             | 0x84            | 0x04             |
| [5]             | 0x85            | 0x05             |
| [6]             | 0x86            | 0x06             |
| [7]             | 0x87            | 0x07             |

Table 132: Bulk/interrupt endpoint numbering

A bulk/interrupt transaction consists of a single data stage. Two consecutive, successful transactions are distinguished through alternating leading process ID (PID): DATA0 follows DATA1, DATA1 follows DATA0,

etc. A repeated transaction is detected by re-using the same PID as previous transaction, i.e DATA0 follows DATA0, or DATA1 follows DATA1.

The USB controller automatically toggles DATA0/DATA1 PIDs for every bulk/interrupt transaction, and in general software does not need to care about it.

If an incoming data is corrupted (CRC does not match), the USB controller automatically prevents DATA0/DATA1 from toggling, to request the host to resend the data.

In some specific cases, the software may want to force a data toggle (usually reset) on a specific IN endpoint, or force the expected toggle on an OUT endpoint, for instance as a consequence of the host issuing **ClearFeature**, **SetInterface** or selecting an alternate setting. Controlling the data toggle of data IN or OUT endpoint  $n$  ( $n=1..7$ ) is done through register **DTOGGLE**.

The bulk/interrupt transaction in USB full-speed can be of any size up to 64 bytes, and it has to be a multiple of 4 bytes and 32-bit aligned in memory.

When the transaction is done over USB, an EPDATA event is generated. The hardware will then automatically respond with NAK to all incoming IN tokens until the software is ready to send more data and has finished configuring the EasyDMA, started it, and the whole buffer content has been moved to USB controller (signalled by the ENDEPIN[ $n$ ] event).

Each IN or OUT data endpoint has to be explicitly enabled by software through register **EPINEN** or **EPOUTEN**, according to the configuration declared by the device and selected by the host through the **SetConfig** command.

A disabled data endpoint will not respond to any traffic from the host. An enabled data endpoint will normally respond NAK or ACK (depending on the readiness of the buffers), or STALL (if configured in register **EPSTALL**), in which case the endpoint is asked to halt). The halted (or not) state of a given endpoint can be read back from register HALTED.EPIN[ $n$ ] or HALTED.EPOUT[ $n$ ]. The format of the returned 16-bit value can be copied as is as response to a **GetStatusEndpoint** request from the host.

Note that enabling or disabling an endpoint will not change its halted state. However, a USB reset will disable and clear the halted state of all data endpoints.

The control endpoint 0 IN and OUT can also be enabled and/or halted using the same mechanisms, but due to USB specification, receiving a SETUP will override its state.

### 6.33.10.1 Bulk and interrupt IN transaction

The host issues IN tokens to receive bulk/interrupt data. In order to send data, the software has to enable the endpoint and prepare an EasyDMA transfer on the desired endpoint.

Bulk/interrupt IN endpoints are enabled or disabled through their respective IN $n$  bit ( $n=1..7$ ) in **EPINEN** register.

It is also possible to stall or un-stall an endpoint through the **EPSTALL** register.

Figure 187: Bulk/interrupt IN transaction

It is possible (and in some situations it is required) to respond to an IN token with a zero-length data packet.

**Note:** On many USB hosts, not responding (DATA+ACK or NAK) to three IN tokens on an interrupt endpoint would have the host disable that endpoint as a consequence. Re-enumerating the device (unplug-replug) may be required to restore functionality. Make sure that the relevant data endpoints are enabled for normal operation as soon as the device gets configured through a **SetConfig** request.

### 6.33.10.2 Bulk and interrupt OUT transaction

When the host wants to transmit bulk/interrupt data, it issues an OUT token (packet) followed by a DATA packet on a given endpoint  $n$  ( $n=1..7$ ).

A NAK is returned until the software writes any value to register `SIZE.EPOUT[n]`, indicating that the content of the local buffer can be overwritten. Upon receiving the next OUT+DATA transaction, an ACK is returned to the host while an `EPDATA` event is generated (and the `EPDATASTATUS` register flags are set to indicate on which endpoint this happened). Once the EasyDMA is prepared and enabled, by writing the `EPOUT[n]` registers and triggering the `STARTEPOUT[n]` task, the incoming data will be transferred to memory. Until that transfer is finished, the hardware will automatically NAK any other incoming OUT+DATA packets. Only when the EasyDMA transfer is done (signalled by the `ENDEPOUT[n]` event), or as soon as any values are written by the software in register `SIZE.EPOUT[n]`, the endpoint  $n$  will accept incoming OUT+DATA again.

It is allowed for the host to send zero-length data packets.

Bulk/interrupt OUT endpoints are enabled or disabled through their respective `OUTn` bit ( $n=1..7$ ) in the `EPOUTEN` register. It is also possible to stall or un-stall an endpoint through the `EPSTALL` register.

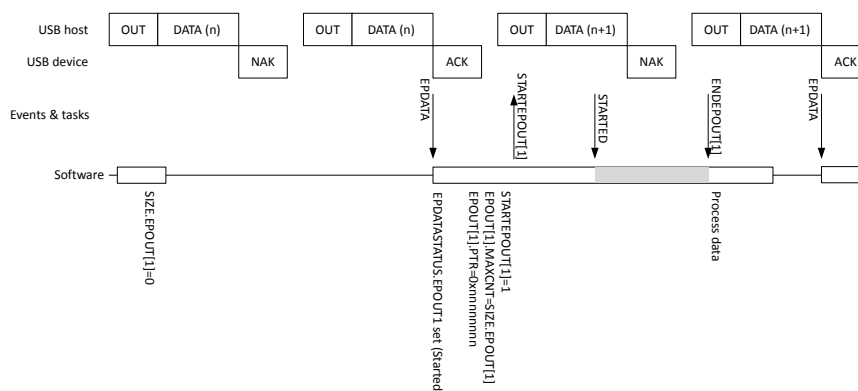

Figure 188: Bulk/interrupt OUT transaction

### 6.33.11 Isochronous transactions

The USB peripheral implements isochronous (ISO) endpoints.

The ISO endpoints have a fixed USB endpoint number, summarized in the table below.

| ISO endpoint # | USB IN endpoint | USB OUT endpoint |
|----------------|-----------------|------------------|
| [0]            | 0x88            | 0x08             |

Table 133: Isochronous endpoint numbering

An isochronous transaction consists of a single, non-acknowledged data stage. The host sends out a start of frame at a regular interval (1 ms), and data follows IN or OUT tokens within each frame.

EasyDMA allows transferring ISO data directly from and to memory. EasyDMA transfers must be initiated by the software, which can synchronize with the SOF (start of frame) events.

Because the timing of the start of frame is very accurate, the SOF event can be used for instance to synchronize a local timer through the SOF event and PPI. The SOF event gets synchronized to the 16 MHz clock prior to being made available to the PPI.

Every start of frame increments a free-running counter, which can be read by software through the `FRAMECNTR` register.

Each IN or OUT ISO data endpoint has to be explicitly enabled by software through register `EPINEN` or `EPOUTEN`, according to the configuration declared by the device and selected by the host through the `SetConfig` command. A disabled ISO IN data endpoint will not respond to any traffic from the host. A disabled ISO OUT data endpoint will ignore any incoming traffic from the host.

The USB peripheral has an internal 1 kB buffer associated with ISO endpoints. The user can either allocate the full amount to the IN or the OUT endpoint, or split the buffer allocation between the two using register `ISOSPLIT`.

The internal buffer also sets the maximum size of the ISO OUT and ISO IN transfers: 1023 bytes when the full buffer is dedicated to either ISO OUT or ISO IN, and half when the buffer is split between the two.

#### 6.33.11.1 Isochronous IN transaction

When the host wants to receive isochronous (ISO) data, it issues an IN token on the isochronous endpoint.

After the data has been transferred using the EasyDMA, the USB controller on the isochronous IN endpoint responds to the IN token with the transferred data using the `ISOIN.MAXCNT` for the size of the packet.

The ISO IN data endpoint has to be explicitly enabled by software through the ISOIN0 bit in register [EPINEN](#).

When an ISO IN endpoint is enabled and no data transferred with EasyDMA, the response of the USB D depends on the setting of the RESPONSE field in register [ISOINCONFIG](#) - it can either provide no response to an IN token or respond with a zero-length data.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an ISO IN transfer in USB full-speed is 1023 bytes, and the data buffer has to be a multiple of 4 bytes 32-bit aligned in memory. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes, if not shared with an OUT ISO endpoint).

Figure 189: Isochronous IN transfer

### 6.33.11.2 Isochronous OUT transaction

When the host wants to send isochronous (ISO) data, it issues an OUT token on the isochronous endpoint, followed by data.

The ISO OUT data endpoint has to be explicitly enabled by software through the ISOOUT0 bit in register [EPOUTEN](#).

The amount of last received ISO OUT data is provided in the [SIZE.ISOOUT](#) register. Software shall interpret the ZERO and SIZE fields as follows:

| ZERO     | SIZE              | Last received data size          |
|----------|-------------------|----------------------------------|
| Normal   | 0                 | No data received at all          |
| Normal   | 1..1023           | 1..1023 bytes of data received   |
| ZeroData | (not of interest) | Zero-length data packet received |

Table 134: ISO OUT incoming data size

When EasyDMA is prepared and started, triggering a STARTISOOUT task initiates an EasyDMA transfer to memory. Software shall synchronize ISO OUT transfers with the SOF events. EasyDMA uses the address in [ISOOUT.PTR](#) and size in [ISOOUT.MAXCNT](#) for every new transfer.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an isochronous OUT transfer in USB full-speed is 1023 bytes, and the data buffer has to be a multiple of 4 bytes and 32-bit aligned in Data RAM. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes if not shared with an IN ISO endpoint).

If the last received ISO data packet is corrupted (wrong CRC), the USB controller generates an USBEVENT event (at the same time as SOF) and indicates a CRC error on ISOOUTCRC in register [EVENTCAUSE](#). EasyDMA will transfer the data anyway if it has been set up properly.

Figure 190: Isochronous OUT transfer

### 6.33.12 USB register access limitations

Some of the registers in USBD cannot be accessed in specific conditions.

This may be the case when USBD is not enabled (using the [ENABLE](#) register) and ready (signalled by the READY bit in [EVENTCAUSE](#) after a USBEVENT event), or when USBD is in low power mode while the USB bus is suspended.

Triggering any tasks, including the tasks triggered through the PPI, is affected by this behavior. In addition, the following registers are affected:

- HALTED.EPIN[0..7]
- HALTED.EPOUT[0..7]
- USBADDR
- BMREQUESTTYPE
- BREQUEST
- WVALUEL
- WVALUEH
- WINDEXL
- WINDEXH
- WLENGTHL
- WLENGTHH
- SIZE.EPOUT[0..7]
- SIZE.ISOOUT
- USBPULLUP
- DTOGGLE

- EPINEN
- EPOUTEN
- EPSTALL
- ISOSPLIT
- FRAMECNTR

### 6.33.13 Registers

| Base address | Peripheral | Instance | Description                 | Configuration |
|--------------|------------|----------|-----------------------------|---------------|
| 0x40027000   | USB        | USB      | Universal serial bus device |               |

Table 135: Instances

| Register            | Offset | Description   |
|---------------------|--------|---|
| TASKS_STARTEPIN[0]  | 0x004  | Captures the EPIN[0].PTR and EPIN[0].MAXCNT registers values, and enables endpoint IN 0 to respond to traffic from host |
| TASKS_STARTEPIN[1]  | 0x008  | Captures the EPIN[1].PTR and EPIN[1].MAXCNT registers values, and enables endpoint IN 1 to respond to traffic from host |
| TASKS_STARTEPIN[2]  | 0x00C  | Captures the EPIN[2].PTR and EPIN[2].MAXCNT registers values, and enables endpoint IN 2 to respond to traffic from host |
| TASKS_STARTEPIN[3]  | 0x010  | Captures the EPIN[3].PTR and EPIN[3].MAXCNT registers values, and enables endpoint IN 3 to respond to traffic from host |
| TASKS_STARTEPIN[4]  | 0x014  | Captures the EPIN[4].PTR and EPIN[4].MAXCNT registers values, and enables endpoint IN 4 to respond to traffic from host |
| TASKS_STARTEPIN[5]  | 0x018  | Captures the EPIN[5].PTR and EPIN[5].MAXCNT registers values, and enables endpoint IN 5 to respond to traffic from host |
| TASKS_STARTEPIN[6]  | 0x01C  | Captures the EPIN[6].PTR and EPIN[6].MAXCNT registers values, and enables endpoint IN 6 to respond to traffic from host |
| TASKS_STARTEPIN[7]  | 0x020  | Captures the EPIN[7].PTR and EPIN[7].MAXCNT registers values, and enables endpoint IN 7 to respond to traffic from host |
| TASKS_STARTISOIN    | 0x024  | Captures the ISOIN.PTR and ISOIN.MAXCNT registers values, and enables sending data on ISO endpoint                      |
| TASKS_STARTEPOUT[0] | 0x028  | Captures the EPOUT[0].PTR and EPOUT[0].MAXCNT registers values, and enables endpoint 0 to respond to traffic from host  |
| TASKS_STARTEPOUT[1] | 0x02C  | Captures the EPOUT[1].PTR and EPOUT[1].MAXCNT registers values, and enables endpoint 1 to respond to traffic from host  |
| TASKS_STARTEPOUT[2] | 0x030  | Captures the EPOUT[2].PTR and EPOUT[2].MAXCNT registers values, and enables endpoint 2 to respond to traffic from host  |
| TASKS_STARTEPOUT[3] | 0x034  | Captures the EPOUT[3].PTR and EPOUT[3].MAXCNT registers values, and enables endpoint 3 to respond to traffic from host  |
| TASKS_STARTEPOUT[4] | 0x038  | Captures the EPOUT[4].PTR and EPOUT[4].MAXCNT registers values, and enables endpoint 4 to respond to traffic from host  |
| TASKS_STARTEPOUT[5] | 0x03C  | Captures the EPOUT[5].PTR and EPOUT[5].MAXCNT registers values, and enables endpoint 5 to respond to traffic from host  |
| TASKS_STARTEPOUT[6] | 0x040  | Captures the EPOUT[6].PTR and EPOUT[6].MAXCNT registers values, and enables endpoint 6 to respond to traffic from host  |
| TASKS_STARTEPOUT[7] | 0x044  | Captures the EPOUT[7].PTR and EPOUT[7].MAXCNT registers values, and enables endpoint 7 to respond to traffic from host  |
| TASKS_STARTISOOUT   | 0x048  | Captures the ISOOUT.PTR and ISOOUT.MAXCNT registers values, and enables receiving of data on ISO endpoint               |
| TASKS_EPORCVOUT     | 0x04C  | Allows OUT data stage on control endpoint 0   |
| TASKS_EPOSTATUS     | 0x050  | Allows status stage on control endpoint 0   |
| TASKS_EPOSTALL      | 0x054  | Stalls data and status stage on control endpoint 0  |

| Register           | Offset | Description   |
|--------------------|--------|---|
| TASKS_DPDMDRIVE    | 0x058  | Forces D+ and D- lines into the state defined in the DPDMVALUE register   |
| TASKS_DPDMNODRIVE  | 0x05C  | Stops forcing D+ and D- lines into any state (USB engine takes control)   |
| EVENTS_USBRESET    | 0x100  | Signals that a USB reset condition has been detected on USB lines   |
| EVENTS_STARTED     | 0x104  | Confirms that the EPIN[n].PTR and EPIN[n].MAXCNT, or EPOUT[n].PTR and EPOUT[n].MAXCNT registers have been captured on all endpoints reported in the EPSTATUS register |
| EVENTS_ENDEPIN[0]  | 0x108  | The whole EPIN[0] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[1]  | 0x10C  | The whole EPIN[1] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[2]  | 0x110  | The whole EPIN[2] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[3]  | 0x114  | The whole EPIN[3] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[4]  | 0x118  | The whole EPIN[4] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[5]  | 0x11C  | The whole EPIN[5] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[6]  | 0x120  | The whole EPIN[6] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPIN[7]  | 0x124  | The whole EPIN[7] buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_EPODATADONE | 0x128  | An acknowledged data transfer has taken place on the control endpoint   |
| EVENTS_ENDISOIN    | 0x12C  | The whole ISOIN buffer has been consumed. The buffer can be accessed safely by software.  |
| EVENTS_ENDEPOUT[0] | 0x130  | The whole EPOUT[0] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[1] | 0x134  | The whole EPOUT[1] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[2] | 0x138  | The whole EPOUT[2] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[3] | 0x13C  | The whole EPOUT[3] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[4] | 0x140  | The whole EPOUT[4] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[5] | 0x144  | The whole EPOUT[5] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[6] | 0x148  | The whole EPOUT[6] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDEPOUT[7] | 0x14C  | The whole EPOUT[7] buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_ENDISOOUT   | 0x150  | The whole ISOOUT buffer has been consumed. The buffer can be accessed safely by software.   |
| EVENTS_SOF         | 0x154  | Signals that a SOF (start of frame) condition has been detected on USB lines  |
| EVENTS_USBEVENT    | 0x158  | An event or an error not covered by specific events has occurred. Check EVENTCAUSE register to find the cause.  |
| EVENTS_EPOSETUP    | 0x15C  | A valid SETUP token has been received (and acknowledged) on the control endpoint  |
| EVENTS_EPDATA      | 0x160  | A data transfer has occurred on a data endpoint, indicated by the EPDATASTATUS register   |
| SHORTS             | 0x200  | Shortcuts between local events and tasks  |
| INTEN              | 0x300  | Enable or disable interrupt   |
| INTENSET           | 0x304  | Enable interrupt  |
| INTENCLR           | 0x308  | Disable interrupt   |
| EVENTCAUSE         | 0x400  | Details on what caused the USBEVENT event   |
| HALTED.EPIN[0]     | 0x420  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[1]     | 0x424  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[2]     | 0x428  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[3]     | 0x42C  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[4]     | 0x430  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[5]     | 0x434  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[6]     | 0x438  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPIN[7]     | 0x43C  | IN endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[0]    | 0x444  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.   |

| Register        | Offset | Description  |
|-----------------|--------|--|
| HALTED.EPOUT[1] | 0x448  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[2] | 0x44C  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[3] | 0x450  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[4] | 0x454  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[5] | 0x458  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[6] | 0x45C  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| HALTED.EPOUT[7] | 0x460  | OUT endpoint halted status. Can be used as is as response to a GetStatus() request to endpoint.  |
| EPSTATUS        | 0x468  | Provides information on which endpoint's EasyDMA registers have been captured  |
| EPDATASTATUS    | 0x46C  | Provides information on which endpoint(s) an acknowledged data transfer has occurred (EPDATA event)  |
| USBADDR         | 0x470  | Device USB address   |
| BMREQUESTTYPE   | 0x480  | SETUP data, byte 0, bmRequestType  |
| BREQUEST        | 0x484  | SETUP data, byte 1, bRequest   |
| WVALUEL         | 0x488  | SETUP data, byte 2, LSB of wValue  |
| WVALUEH         | 0x48C  | SETUP data, byte 3, MSB of wValue  |
| WINDEXL         | 0x490  | SETUP data, byte 4, LSB of wIndex  |
| WINDEXH         | 0x494  | SETUP data, byte 5, MSB of wIndex  |
| WLENGTHL        | 0x498  | SETUP data, byte 6, LSB of wLength   |
| WLENGTHH        | 0x49C  | SETUP data, byte 7, MSB of wLength   |
| SIZE.EPOUT[0]   | 0x4A0  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[1]   | 0x4A4  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[2]   | 0x4A8  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[3]   | 0x4AC  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[4]   | 0x4B0  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[5]   | 0x4B4  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[6]   | 0x4B8  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.EPOUT[7]   | 0x4BC  | Number of bytes received last in the data stage of this OUT endpoint   |
| SIZE.ISOOUT     | 0x4C0  | Number of bytes received last on this ISO OUT data endpoint  |
| ENABLE          | 0x500  | Enable USB   |
| USBPULLUP       | 0x504  | Control of the USB pull-up   |
| DPDMVALUE       | 0x508  | State D+ and D- lines will be forced into by the DPDMDRIVE task. The DPDMNODRIVE task reverts the control of the lines to MAC IP (no forcing). |
| DTOGGLE         | 0x50C  | Data toggle control and status   |
| EPINEN          | 0x510  | Endpoint IN enable   |
| EPOUTEN         | 0x514  | Endpoint OUT enable  |
| EPSTALL         | 0x518  | STALL endpoints  |
| ISOSPLIT        | 0x51C  | Controls the split of ISO buffers  |
| FRAMECNTR       | 0x520  | Returns the current value of the start of frame counter  |
| LOWPOWER        | 0x52C  | Controls USB peripheral low power mode during USB suspend  |
| ISOINCONFIG     | 0x530  | Controls the response of the ISO IN endpoint to an IN token when no data is ready to be sent   |
| EPIN[0].PTR     | 0x600  | Data pointer   |
| EPIN[0].MAXCNT  | 0x604  | Maximum number of bytes to transfer  |
| EPIN[0].AMOUNT  | 0x608  | Number of bytes transferred in the last transaction  |
| EPIN[1].PTR     | 0x614  | Data pointer   |
| EPIN[1].MAXCNT  | 0x618  | Maximum number of bytes to transfer  |
| EPIN[1].AMOUNT  | 0x61C  | Number of bytes transferred in the last transaction  |

| Register        | Offset | Description   |
|-----------------|--------|---|
| EPIN[2].PTR     | 0x628  | Data pointer  |
| EPIN[2].MAXCNT  | 0x62C  | Maximum number of bytes to transfer                 |
| EPIN[2].AMOUNT  | 0x630  | Number of bytes transferred in the last transaction |
| EPIN[3].PTR     | 0x63C  | Data pointer  |
| EPIN[3].MAXCNT  | 0x640  | Maximum number of bytes to transfer                 |
| EPIN[3].AMOUNT  | 0x644  | Number of bytes transferred in the last transaction |
| EPIN[4].PTR     | 0x650  | Data pointer  |
| EPIN[4].MAXCNT  | 0x654  | Maximum number of bytes to transfer                 |
| EPIN[4].AMOUNT  | 0x658  | Number of bytes transferred in the last transaction |
| EPIN[5].PTR     | 0x664  | Data pointer  |
| EPIN[5].MAXCNT  | 0x668  | Maximum number of bytes to transfer                 |
| EPIN[5].AMOUNT  | 0x66C  | Number of bytes transferred in the last transaction |
| EPIN[6].PTR     | 0x678  | Data pointer  |
| EPIN[6].MAXCNT  | 0x67C  | Maximum number of bytes to transfer                 |
| EPIN[6].AMOUNT  | 0x680  | Number of bytes transferred in the last transaction |
| EPIN[7].PTR     | 0x68C  | Data pointer  |
| EPIN[7].MAXCNT  | 0x690  | Maximum number of bytes to transfer                 |
| EPIN[7].AMOUNT  | 0x694  | Number of bytes transferred in the last transaction |
| ISOIN.PTR       | 0x6A0  | Data pointer  |
| ISOIN.MAXCNT    | 0x6A4  | Maximum number of bytes to transfer                 |
| ISOIN.AMOUNT    | 0x6A8  | Number of bytes transferred in the last transaction |
| EPOUT[0].PTR    | 0x700  | Data pointer  |
| EPOUT[0].MAXCNT | 0x704  | Maximum number of bytes to transfer                 |
| EPOUT[0].AMOUNT | 0x708  | Number of bytes transferred in the last transaction |
| EPOUT[1].PTR    | 0x714  | Data pointer  |
| EPOUT[1].MAXCNT | 0x718  | Maximum number of bytes to transfer                 |
| EPOUT[1].AMOUNT | 0x71C  | Number of bytes transferred in the last transaction |
| EPOUT[2].PTR    | 0x728  | Data pointer  |
| EPOUT[2].MAXCNT | 0x72C  | Maximum number of bytes to transfer                 |
| EPOUT[2].AMOUNT | 0x730  | Number of bytes transferred in the last transaction |
| EPOUT[3].PTR    | 0x73C  | Data pointer  |
| EPOUT[3].MAXCNT | 0x740  | Maximum number of bytes to transfer                 |
| EPOUT[3].AMOUNT | 0x744  | Number of bytes transferred in the last transaction |
| EPOUT[4].PTR    | 0x750  | Data pointer  |
| EPOUT[4].MAXCNT | 0x754  | Maximum number of bytes to transfer                 |
| EPOUT[4].AMOUNT | 0x758  | Number of bytes transferred in the last transaction |
| EPOUT[5].PTR    | 0x764  | Data pointer  |
| EPOUT[5].MAXCNT | 0x768  | Maximum number of bytes to transfer                 |
| EPOUT[5].AMOUNT | 0x76C  | Number of bytes transferred in the last transaction |
| EPOUT[6].PTR    | 0x778  | Data pointer  |
| EPOUT[6].MAXCNT | 0x77C  | Maximum number of bytes to transfer                 |
| EPOUT[6].AMOUNT | 0x780  | Number of bytes transferred in the last transaction |
| EPOUT[7].PTR    | 0x78C  | Data pointer  |
| EPOUT[7].MAXCNT | 0x790  | Maximum number of bytes to transfer                 |
| EPOUT[7].AMOUNT | 0x794  | Number of bytes transferred in the last transaction |
| ISOOUT.PTR      | 0x7A0  | Data pointer  |
| ISOOUT.MAXCNT   | 0x7A4  | Maximum number of bytes to transfer                 |
| ISOOUT.AMOUNT   | 0x7A8  | Number of bytes transferred in the last transaction |

Table 136: Register overview

### 6.33.13.1 TASKS\_STARTEPIN[n] (n=0..7)

Address offset: 0x004 + (n × 0x4)

Captures the EPIN[n].PTR and EPIN[n].MAXCNT registers values, and enables endpoint IN n to respond to traffic from host

| Bit number | 31         | 30              | 29    | 28  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|------------|-----------------|-------|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| ID         |            |                 |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   | A |
| Reset      | 0x00000000 |                 |       |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 6.33.14 Electrical specification

### 6.33.14.1 USB Electrical Specification

| Symbol                     | Description  | Min. | Typ. | Max.  | Units |
|----------------------------|--|------|------|-------|-------|
| R <sub>USB,PU,ACTIVE</sub> | Value of pull-up on D+, bus active (upstream device transmitting)        | 1425 | 2300 | 3090  | Ω     |
| R <sub>USB,PU,IDLE</sub>   | Value of pull-up on D+, bus idle   | 900  | 1200 | 1575  | Ω     |
| t <sub>USB,DETRST</sub>    | Minimum duration of an SE0 state to be detected as a USB reset condition |      |      |       | μs    |
| f <sub>USB,CLK</sub>       | Frequency of local clock, USB active                                     |      | 48   |       | MHz   |
| f <sub>USB,TOL</sub>       | Accuracy of local clock, USB active <sup>41</sup>                        |      |      | ±1000 | ppm   |
| T <sub>USB,JITTER</sub>    | Jitter on USB local clock, USB active                                    |      |      | ±1    | ns    |

## 6.34 WDT — Watchdog timer

A countdown watchdog timer using the low-frequency clock source (LFCLK) offers configurable and robust protection against application lock-up.

The watchdog timer is started by triggering the START task.

The watchdog can be paused during long CPU sleep periods for low power applications and when the debugger has halted the CPU. The watchdog is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When the watchdog timer is started through the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

The watchdog's timeout period is given by the following equation:

$$\text{timeout [s]} = ( \text{CRV} + 1 ) / 32768$$

<sup>41</sup> The local clock can be stopped during USB suspend

When started, the watchdog will automatically force the 32.768 kHz RC oscillator on as long as no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 80.

### 6.34.1 Reload criteria

The watchdog has eight separate reload request registers, which shall be used to request the watchdog to reload its counter with the value specified in the CRV register. To reload the watchdog counter, the special value 0x6E524635 needs to be written to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

### 6.34.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping and when it is halted by the debugger. It is possible to configure the watchdog to automatically pause while the CPU is sleeping as well as when it is halted by the debugger.

### 6.34.3 Watchdog reset

A TIMEOUT event will automatically lead to a watchdog reset.

See [Reset](#) on page 67 for more information about reset sources. If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset will be postponed with two 32.768 kHz clock cycles after the TIMEOUT event has been generated. Once the TIMEOUT event has been generated, the impending watchdog reset will always be effectuated.

The watchdog must be configured before it is started. After it is started, the watchdog's configuration registers, which comprise registers CRV, RREN, and CONFIG, will be blocked for further configuration.

The watchdog can be reset from several reset sources, see [Reset behavior](#) on page 68.

When the device starts running again, after a reset, or waking up from OFF mode, the watchdog configuration registers will be available for configuration again.

### 6.34.4 Registers

| Base address | Peripheral | Instance | Description    | Configuration |
|--------------|------------|----------|----------------|---------------|
| 0x40010000   | WDT        | WDT      | Watchdog timer |               |

Table 137: Instances

| Register       | Offset | Description                                  |
|----------------|--------|--|
| TASKS_START    | 0x000  | Start the watchdog                           |
| EVENTS_TIMEOUT | 0x100  | Watchdog timeout                             |
| INTENSET       | 0x304  | Enable interrupt                             |

## 6.34.5 Electrical specification

### 6.34.5.1 Watchdog Timer Electrical Specification

| Symbol           | Description       | Min. | Typ. | Max. | Units |
|------------------|-------------------|------|------|------|-------|
| t <sub>WDT</sub> | Time out interval | 458  |      | 36   | μs    |

# 7 Hardware and layout

## 7.1 Pin assignments

The pin assignment figures and tables describe the pinouts for the product variants of the chip.

The nRF52833 device provides flexibility regarding GPIO pin routing and configuration. However, some pins have limitations or recommendations for pin configurations and uses.

### 7.1.1 aQFN73 ball assignments

The ball assignment figure and table in the following section describe the assignments for this variant of the chip.

Figure 191: aQFN<sup>™</sup>73 ball assignments, top view

| Pin | Name   | Function     | Description                           | Recommended usage   |
|-----|--------|--------------|---------------------------------------|---|
| A8  | P0.31  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN7   | Analog input | Analog input                          |   |
| A10 | P0.29  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN5   | Analog input | Analog input                          |   |
| A12 | P0.02  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN0   | Analog input | Analog input                          |   |
| A14 | P0.19  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
| A16 | P1.05  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
| A18 | N.C.   |              |                                       |   |
| A20 | P0.25  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
| A22 | VDD    | Power        | Power supply                          |   |
| A23 | XC2    | Analog input | Connection for 32 MHz crystal         |   |
| B1  | VDD    | Power        | Power supply                          |   |
| B3  | DCC    | Power        | DC/DC converter output                |   |
| B5  | DEC4   | Power        | 1.3 V regulator supply decoupling     | Must be connected to DEC6 (pin E24)   |
| B7  | VSS    | Power        | Ground                                |   |
| B9  | P0.30  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN6   | Analog input | Analog input                          |   |
| B11 | P0.28  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN4   | Analog input | Analog input                          |   |
| B13 | P0.03  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | AIN1   | Analog input | Analog input                          |   |
| B15 | P1.03  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
| B17 | P0.23  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
| B19 | N.C.   |              |                                       |   |
| B24 | XC1    | Analog input | Connection for 32 MHz crystal         |   |
| C1  | DEC1   | Power        | 1.1 V regulator supply decoupling     |   |
| D2  | P0.00  | Digital I/O  | General purpose I/O                   |   |
|     | XL1    | Analog input | Connection for 32.768 kHz crystal     |   |
| D23 | DEC3   | Power        | Power supply, decoupling              |   |
| E24 | DEC6   | Power        | 1.3 V regulator supply decoupling     | Must be connected to DEC4 (pin B5)  |
| F2  | P0.01  | Digital I/O  | General purpose I/O                   |   |
|     | XL2    | Analog input | Connection for 32.768 kHz crystal     |   |
| F23 | VSS_PA | Power        | Ground (radio supply)                 |   |
| G1  | P0.26  | Digital I/O  | General purpose I/O                   |   |
| H2  | P0.27  | Digital I/O  | General purpose I/O                   |   |
| H23 | ANT    | RF           | Single-ended radio antenna connection | See <a href="#">Reference circuitry</a> on page 567 for guidelines on how to ensure good RF performance |
| J1  | P0.04  | Digital I/O  | General purpose I/O                   |   |
|     | AIN2   | Analog input | Analog input                          |   |
| J24 | P0.10  | Digital I/O  | General purpose I/O                   | Standard drive, low frequency I/O only  |
|     | NFC2   | NFC input    | NFC antenna connection                |   |

| Pin  | Name       | Function     | Description   | Recommended usage                      |
|------|------------|--------------|---|--|
| K2   | P0.05      | Digital I/O  | General purpose I/O                                     |  |
|      | AIN3       | Analog input | Analog input  |  |
| L1   | P0.06      | Digital I/O  | General purpose I/O                                     |  |
| L24  | P0.09      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
|      | NFC1       | NFC input    | NFC antenna connection                                  |  |
| M2   | P0.07      | Digital I/O  | General purpose I/O                                     |  |
|      | TRACECLK   | Trace clock  | Trace buffer clock                                      |  |
| N1   | P0.08      | Digital I/O  | General purpose I/O                                     |  |
| N24  | DEC5       | Power        | 1.3 V regulator supply decoupling                       |  |
| P2   | P1.08      | Digital I/O  | General purpose I/O                                     |  |
| P23  | P1.07      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
| R1   | P1.09      | Digital I/O  | General purpose I/O                                     |  |
|      | TRACEDATA3 | Trace data   | Trace buffer TRACEDATA[3]                               |  |
| R24  | P1.06      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
| T2   | P0.11      | Digital I/O  | General purpose I/O                                     |  |
|      | TRACEDATA2 | Trace data   | Trace buffer TRACEDATA[2]                               |  |
| T23  | N.C.       |              |   |  |
| U1   | P0.12      | Digital I/O  | General purpose I/O                                     |  |
|      | TRACEDATA1 | Trace data   | Trace buffer TRACEDATA[1]                               |  |
| U24  | P1.04      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
| V23  | N.C.       |              |   |  |
| W1   | VDD        | Power        | Power supply  |  |
| W24  | P1.02      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
| Y2   | VDDH       | Power        | High voltage power supply                               |  |
| Y23  | P1.01      | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only |
| AA24 | SWDCLK     | Debug        | Serial wire debug clock input for debug and programming |  |
| AB2  | N.C.       |              |   |  |
| AC5  | DECUSB     | Power        | USB 3.3 V regulator supply decoupling                   |  |
| AC9  | P0.14      | Digital I/O  | General purpose I/O                                     |  |
| AC11 | P0.16      | Digital I/O  | General purpose I/O                                     |  |
| AC13 | P0.18      | Digital I/O  | General purpose I/O                                     |  |
|      | nRESET     |              | Configurable as pin RESET                               |  |
| AC15 | N.C.       |              |   |  |
| AC17 | P0.21      | Digital I/O  | General purpose I/O                                     |  |
| AC19 | N.C.       |              |   |  |
| AC21 | N.C.       |              |   |  |
| AC24 | SWDIO      | Debug        | Serial wire debug I/O for debug and programming         |  |
| AD2  | VBUS       | Power        | 5 V input for USB 3.3 V regulator                       |  |
| AD4  | D-         | USB          | USB D-  |  |
| AD6  | D+         | USB          | USB D+  |  |
| AD8  | P0.13      | Digital I/O  | General purpose I/O                                     |  |
| AD10 | P0.15      | Digital I/O  | General purpose I/O                                     |  |
| AD12 | P0.17      | Digital I/O  | General purpose I/O                                     |  |
| AD14 | VDD        | Power        | Power supply  |  |
| AD16 | P0.20      | Digital I/O  | General purpose I/O                                     |  |

| Pin     | Name       | Function    | Description   | Recommended usage   |
|---------|------------|-------------|---|---|
| AD18    | P0.22      | Digital I/O | General purpose I/O                                   |   |
| AD20    | P0.24      | Digital I/O | General purpose I/O                                   |   |
| AD22    | P1.00      | Digital I/O | General purpose I/O                                   |   |
|         | TRACEDATA0 | Trace data  | Trace buffer TRACEDATA[0]<br>Serial wire output (SWO) |   |
| AD23    | VDD        | Power       | Power supply  |   |
| Die pad | VSS        | Power       | Ground pad  | Exposed die pad must be connected to ground (VSS) for proper device operation |

Table 139: aQFN™ 73 ball assignments

**Note:** For more information on standard drive, see [GPIO — General purpose input/output](#) on page 138. Low frequency I/O is a signal with a frequency up to 10 kHz.

**Note:** If SPIM0, SPIM1, or SPIM2 is used with 8 Mbps data rate, the recommended GPIOs for the clock signal (SCK) are P0.27, P1.08, P0.04, and P1.09.

## 7.1.2 QFN40 pin assignments

The pin assignment figure and table describe the assignments for this variant of the chip.

Figure 192: QFN40 pin assignments, top view

| Pin                            | Name   | Function     | Description   | Recommended usage   |
|--------------------------------|--------|--------------|---|---|
| <b>Left side of the chip</b>   |        |              |   |   |
| 1                              | DEC1   | Power        | 1.1 V Digital supply decoupling                         |   |
| 2                              | P0.00  | Digital I/O  | General purpose I/O pin.                                |   |
|                                | XL1    | Analog input | Connection for 32.768 kHz crystal                       |   |
| 3                              | P0.01  | Digital I/O  | General purpose I/O pin                                 |   |
|                                | XL2    | Analog input | Connection for 32.768 kHz crystal                       |   |
| 4                              | P0.04  | Digital I/O  | General purpose I/O pin                                 |   |
|                                | AIN2   | Analog input | Analog input  |   |
| 5                              | P0.05  | Digital I/O  | General purpose I/O pin                                 |   |
|                                | AIN3   | Analog input | Analog input  |   |
| 6                              | P1.09  | Digital I/O  | General purpose I/O pin                                 |   |
| 7                              | P0.11  | Digital I/O  | General purpose I/O pin                                 |   |
| 8                              | VDD    | Power        | Power supply  |   |
| 9                              | VDDH   | Power        | High voltage power supply                               |   |
| 10                             | VBUS   | Power        | 5 V input for USB 3.3 V regulator                       |   |
| <b>Bottom side of the chip</b> |        |              |   |   |
| 11                             | DECUSB | Power        | USB 3.3 V regulator supply decoupling                   |   |
| 12                             | D-     | USB          | USB D-  |   |
| 13                             | D+     | USB          | USB D+  |   |
| 14                             | P0.15  | Digital I/O  | General purpose I/O                                     |   |
| 15                             | P0.17  | Digital I/O  | General purpose I/O                                     |   |
| 16                             | P0.18  | Digital I/O  | General purpose I/O                                     |   |
|                                | nRESET |              | Configurable as pin RESET                               |   |
| 17                             | P0.20  | Digital I/O  | General purpose I/O                                     |   |
| 18                             | VDD    | Power        | Power supply  |   |
| 19                             | SWDIO  | Debug        | Serial wire debug I/O for debug and programming         |   |
| 20                             | SWDCLK | Debug        | Serial wire debug clock input for debug and programming |   |
| <b>Right side of the chip</b>  |        |              |   |   |
| 21                             | DEC5   | Power        | 1.3 V regulator supply decoupling                       |   |
| 22                             | P0.09  | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only  |
|                                | NFC1   | NFC input    | NFC antenna connection                                  |   |
| 23                             | P0.10  | Digital I/O  | General purpose I/O                                     | Standard drive, low frequency I/O only  |
|                                | NFC2   | NFC input    | NFC antenna connection                                  |   |
| 24                             | ANT    | RF           | Single-ended radio antenna connection                   | See <a href="#">Reference circuitry</a> on page 567 for guidelines on how to ensure good RF performance |
| 25                             | VSS_PA | Power        | Ground (radio supply)                                   |   |

|                                | AIN0   | Analog input | Analog input  |   |

| Pin                             | Name  | Function     | Description                       | Recommended usage   |
|---------------------------------|-------|--------------|-----------------------------------|---|
| 33                              | P0.28 | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only  |
|                                 | AIN4  | Analog input | Analog input                      |   |
| 34                              | P0.29 | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only  |
|                                 | AIN5  | Analog input | Analog input                      |   |
| 35                              | P0.30 | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only  |
|                                 | AIN6  | Analog input | Analog input                      |   |
| 36                              | P0.31 | Digital I/O  | General purpose I/O pin           |   |
|                                 | AIN7  | Analog input | Analog input                      |   |
| 37                              | VSS   | Power        | Ground                            |   |
| 38                              | DEC4  | Power        | 1.3 V regulator supply decoupling | Must be connected to DEC6 (pin 26)  |
| 39                              | DCC   | Power        | DC/DC converter output            |   |
| 40                              | VDD   | Power        | Power supply                      |   |
| <b>Backside of the the chip</b> |       |              |                                   |   |
| Die pad                         | VSS   | Power        | Ground pad                        | Exposed die pad must be connected to ground (VSS) for proper device operation |

Table 140: QFN40 pin assignments

**Note:** For more information on standard drive, see [GPIO — General purpose input/output](#) on page 138. Low frequency I/O is a signal with a frequency up to 10 kHz.

**Note:** If SPIM0, SPIM1, or SPIM2 is used with 8 Mbps data rate, the recommended GPIOs for the clock signal (SCK) are P1.09, P0.04, and P0.31.

### 7.1.3 WLCSP ball assignments

The ball assignment figure and table describe the assignments for this variant of the chip.

Figure 193: WLCSP ball assignments, top view

| Pin | Name   | Function     | Description                       | Recommended usage                      |
|-----|--------|--------------|-----------------------------------|--|
| A1  | XC1    | Analog input | Connection for 32 MHz crystal     |  |
| A2  | XC2    | Analog input | Connection for 32 MHz crystal     |  |
| A3  | P0.25  | Digital I/O  | General purpose I/O               | Standard drive, low frequency I/O only |
| A4  | P0.03  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN1   | Analog input | Analog input                      |  |
| A5  | P0.29  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN5   | Analog input | Analog input                      |  |
| A6  | DEC4   | Power        | 1.3 V regulator supply decoupling | Must be connected to DEC6 (ball C2)    |
| A7  | VSS    | Power        | Ground                            |  |
| A8  | DCC    | Power        | DC/DC converter output            |  |
| A9  | VDD    | Power        | Power supply                      |  |
| B3  | VDD    | Power        | Power supply                      |  |
| B4  | P1.03  | Digital I/O  | General purpose I/O               | Standard drive, low frequency I/O only |
| B5  | P0.30  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN6   | Analog input | Analog input                      |  |
| B6  | P0.31  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN7   | Analog input | Analog input                      |  |
| B7  | P0.01  | Digital I/O  | General purpose I/O pin           |  |
|     | XL2    | Analog input | Connection for 32.768 kHz crystal |  |
| B8  | P0.00  | Digital I/O  | General purpose I/O pin.          |  |
|     | XL1    | Analog input | Connection for 32.768 kHz crystal |  |
| B9  | DEC1   | Power        | 1.1 V Digital supply decoupling   |  |
| C1  | VSS_PA | Power        | Ground (radio supply)             |  |
| C2  | DEC6   | Power        | 1.3 V regulator supply decoupling | Must be connected to DEC4 (ball A6)    |
| C4  | P1.05  | Digital I/O  | General purpose I/O               | Standard drive, low frequency I/O only |
| C5  | P0.19  | Digital I/O  | General purpose I/O               | Standard drive, low frequency I/O only |
| C6  | P0.02  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN0   | Analog input | Analog input                      |  |
| C7  | P0.28  | Digital I/O  | General purpose I/O pin           | Standard drive, low frequency I/O only |
|     | AIN4   | Analog input | Analog input                      |  |
| C8  | P0.27  | Digital I/O  | General purpose I/O               |  |
| C9  | P0.26  | Digital I/O  | General purpose I/O               |  |
| D3  | VSS    | Power        | Ground                            |  |
| D4  | VSS    | Power        | Ground                            |  |
| D5  | VSS    | Power        | Ground                            |  |
| D6  | VSS    | Power        | Ground                            |  |
| D7  | P0.23  | Digital I/O  | General purpose I/O               | Standard drive, low frequency I/O only |
| D8  | P0.04  | Digital I/O  | General purpose I/O pin           |  |
|     | AIN2   | Analog input | Analog input                      |  |
| D9  | P0.05  | Digital I/O  | General purpose I/O pin           |  |
|     | AIN3   | Analog input | Analog input                      |  |

| Pin | Name       | Function    | Description   | Recommended usage   |
|-----|------------|-------------|---|---|
| E1  | ANT        | RF          | Single-ended radio antenna connection                   | See <a href="#">Reference circuitry</a> on page 567 for guidelines on how to ensure good RF performance |
| E2  | P0.10      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
|     | NFC2       | NFC input   | NFC antenna connection                                  |   |
| E3  | P1.06      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| E4  | VSS        | Power       | Ground  |   |
| E5  | VSS        | Power       | Ground  |   |
| E6  | VSS        | Power       | Ground  |   |
| E7  | P0.08      | Digital I/O | General purpose I/O                                     |   |
| E8  | P0.07      | Digital I/O | General purpose I/O                                     |   |
|     | TRACECLK   | Trace clock | Trace buffer clock                                      |   |
| E9  | P0.06      | Digital I/O | General purpose I/O                                     |   |
| F1  | DEC5       | Power       | 1.3 V regulator supply decoupling                       |   |
| F2  | P0.09      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
|     | NFC1       | NFC input   | NFC antenna connection                                  |   |
| F3  | P1.01      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| F4  | VSS        | Power       | Ground  |   |
| F5  | VSS        | Power       | Ground  |   |
| F6  | VSS        | Power       | Ground  |   |
| F7  | P0.13      | Digital I/O | General purpose I/O                                     |   |
| F8  | P1.09      | Digital I/O | General purpose I/O                                     |   |
|     | TRACEDATA3 | Trace data  | Trace buffer TRACEDATA[3]                               |   |
| F9  | P1.08      | Digital I/O | General purpose I/O                                     |   |
| G1  | P1.07      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| G2  | P1.04      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| G3  | P0.24      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| G4  | P0.21      | Digital I/O | General purpose I/O                                     |   |
| G5  | P0.20      | Digital I/O | General purpose I/O                                     |   |
| G6  | P0.16      | Digital I/O | General purpose I/O                                     |   |
| G8  | P0.11      | Digital I/O | General purpose I/O                                     |   |
|     | TRACEDATA2 | Trace data  | Trace buffer TRACEDATA[2]                               |   |
| G9  | VDD        | Power       | Power supply  |   |
| H1  | P1.02      | Digital I/O | General purpose I/O                                     | Standard drive, low frequency I/O only  |
| H2  | SWDCLK     | Debug       | Serial wire debug clock input for debug and programming |   |
| H3  | P1.00      | Digital I/O | General purpose I/O                                     |   |
|     | TRACEDATA0 | Trace data  | Trace buffer TRACEDATA[0]<br>Serial wire output (SWO)   |   |
| H4  | P0.18      | Digital I/O | General purpose I/O                                     |   |
|     | nRESET     |             | Configurable as pin RESET                               |   |
| H5  | P0.15      | Digital I/O | General purpose I/O                                     |   |
| H6  | P0.12      | Digital I/O | General purpose I/O                                     |   |
|     | TRACEDATA1 | Trace data  | Trace buffer TRACEDATA[1]                               |   |
| H7  | D-         | USB         | USB D-  |   |

| Pin | Name   | Function    | Description                                     | Recommended usage |
|-----|--------|-------------|---|-------------------|
| H8  | VBUS   | Power       | 5 V input for USB 3.3 V regulator               |                   |
| H9  | VDDH   | Power       | High voltage power supply                       |                   |
| J1  | VDD    | Power       | Power supply                                    |                   |
| J2  | SWDIO  | Debug       | Serial wire debug I/O for debug and programming |                   |
| J3  | P0.22  | Digital I/O | General purpose I/O                             |                   |
| J4  | VDD    | Power       | Power supply                                    |                   |
| J5  | P0.17  | Digital I/O | General purpose I/O                             |                   |
| J6  | P0.14  | Digital I/O | General purpose I/O                             |                   |
| J7  | D+     | USB         | USB D+  |                   |
| J8  | DECUSB | Power       | USB 3.3 V regulator supply decoupling           |                   |
| J9  | VSS    | Power       | Ground  |                   |

Table 141: WLCSP ball assignments

**Note:** For more information on standard drive, see [GPIO — General purpose input/output](#) on page 138. Low frequency I/O is a signal with a frequency up to 10 kHz.

**Note:** If SPIM0, SPIM1, or SPIM2 is used with 8 Mbps data rate, the recommended GPIOs for the clock signal (SCK) are P0.27, P1.08, P0.04, and P1.09.

## 7.2 Mechanical specifications

The mechanical specifications for the packages show the dimensions in millimeters.

### 7.2.1 aQFN73 7 x 7 mm package

Dimensions in millimeters for the aQFN™ 73 7 x 7 mm package.

Figure 194: aQFN™ 73 7 x 7 mm package

|             | A    | A1   | A2    | A3   | b    | D, E | D2, E2 | e   | e1   | e2    |

## 7.3 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from the product page for the nRF52833 on [www.nordicsemi.com](http://www.nordicsemi.com).

In this section there are reference circuits for QIAA aQFN™ 73, CJAA WLCSP, and QDAA QFN40 packages, showing the components and component values to support on-chip features in a design.

**Note:** This is not a complete list of configurations, but all required circuitry is shown for further configurations.

Some general guidance is summarized here:

- When supplying power from a USB source only, VBUS must be connected to VDDH if USB is to be used.
- Components required for DC/DC function are only needed if DC/DC mode is enabled for that regulator.
- NFC can be used in any configuration.
- USB can be used in any configuration as long as VBUS is supplied by the USB host.
- The schematics include an optional series resistor on the USB supply for improved immunity to transient overvoltage during VBUS connection. Using the series resistor is recommended for new designs.

## Circuit configurations for QIAA aQFN™ 73

| Config no. | Supply configuration   |                        | Features that can be enabled for each configuration example |     |     |
|------------|------------------------|------------------------|---|-----|-----|
|            | VDDH                   | VDD                    | DCDCEN1   | USB | NFC |
| Config. 1  | USB (VDDH = VBUS)      | N/A                    | No  | Yes | No  |
| Config. 2  | Battery/Ext. regulator | N/A                    | No  | Yes | No  |
| Config. 3  | N/A                    | Battery/Ext. regulator | No  | Yes | No  |
| Config. 4  | Battery/Ext. regulator | N/A                    | Yes   | Yes | No  |
| Config. 5  | N/A                    | Battery/Ext. regulator | Yes   | Yes | Yes |
| Config. 6  | N/A                    | Battery/Ext. regulator | No  | No  | No  |

Table 145: Circuit configurations

## Circuit configurations for QDAA QFN40

| Config no. | Supply configuration   |                        | Features that can be enabled for each configuration example |     |     |
|------------|------------------------|------------------------|---|-----|-----|
|            | VDDH                   | VDD                    | DCDCEN1   | USB | NFC |
| Config. 1  | USB (VDDH = VBUS)      | N/A                    | No  | Yes | No  |
| Config. 2  | Battery/Ext. regulator | N/A                    | No  | Yes | No  |
| Config. 3  | N/A                    | Battery/Ext. regulator | No  | Yes | No  |
| Config. 4  | Battery/Ext. regulator | N/A                    | Yes   | Yes | No  |
| Config. 5  | N/A                    | Battery/Ext. regulator | Yes   | Yes | Yes |
| Config. 6  | N/A                    | Battery/Ext. regulator | No  | No  | No  |

Table 146: Circuit configurations

## Circuit configurations for CJAA WLCSP

| Config no. | Supply configuration   |                        | Features that can be enabled for each configuration example |     |     |
|------------|------------------------|------------------------|---|-----|-----|
|            | VDDH                   | VDD                    | DCDCEN1   | USB | NFC |
| Config. 1  | USB (VDDH = VBUS)      | N/A                    | No  | Yes | No  |
| Config. 2  | Battery/Ext. regulator | N/A                    | No  | Yes | No  |
| Config. 3  | N/A                    | Battery/Ext. regulator | No  | Yes | No  |
| Config. 4  | Battery/Ext. regulator | N/A                    | Yes   | Yes | No  |
| Config. 5  | N/A                    | Battery/Ext. regulator | Yes   | Yes | Yes |
| Config. 6  | N/A                    | Battery/Ext. regulator | No  | No  | No  |

### 7.3.7 Circuit configuration no. 1 for QDAA QFN40

This section contains a configuration summary, a schematic, and bill of materials table for QDAA QFN40 circuit configuration number 1.

| Config no. | Supply configuration |     | Enabled features |     |     |
|------------|----------------------|-----|------------------|-----|-----|
|            | VDDH                 | VDD | DCDCEN1          | USB | NFC |
| Config. 1  | USB (VDDH = VBUS)    | N/A | No               | Yes | No  |

Table 160: Configuration summary for circuit configuration no. 1

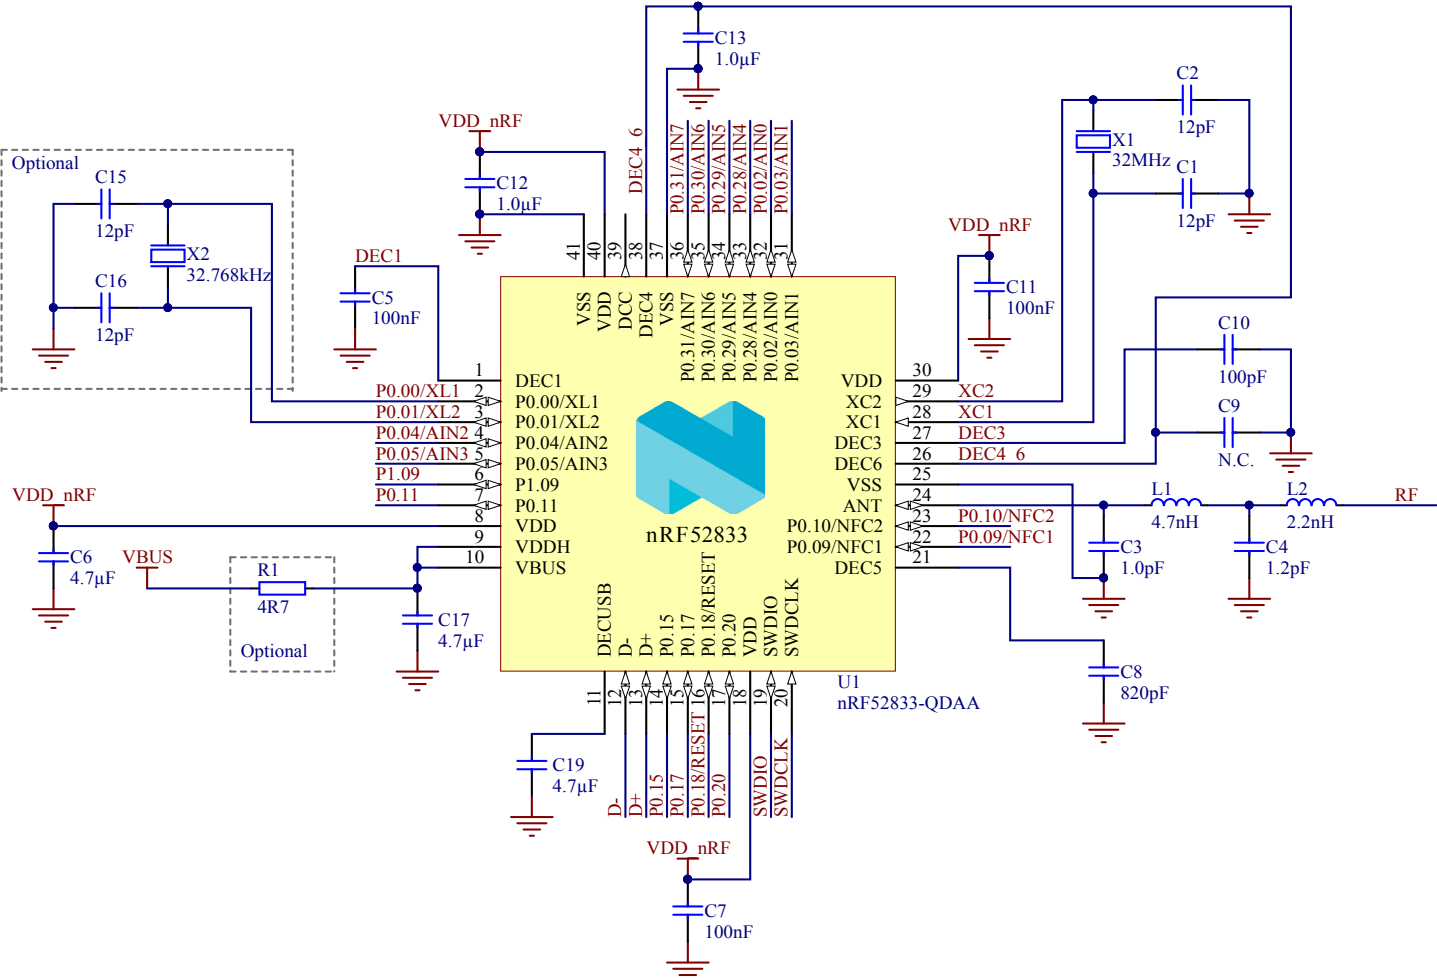

Figure 203: Circuit configuration no. 1 schematic for QDAA QFN40

**Note:** For PCB reference layouts, see the product page for the nRF52833 on [www.nordicsemi.com](http://www.nordicsemi.com).

| Designator       | Value         | Description  | Footprint |
|------------------|---------------|--|-----------|
| C1, C2, C15, C16 | 12 pF         | Capacitor, NPO, $\pm 2\%$  | 0201      |
| C3               | 1.0 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C4               | 1.2 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C5, C7, C11      | 100 nF        | Capacitor, X7S, $\pm 10\%$   | 0201      |
| C6, C19          | 4.7 $\mu$ F   | Capacitor, X7R, $\pm 10\%$   | 0603      |
| C8               | 820 pF        | Capacitor, X7R, $\pm 10\%$   | 0201      |
| C9               | N.C.          | Not mounted  | 0201      |
| C10              | 100 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C12, C13         | 1.0 $\mu$ F   | Capacitor, X7S, $\pm 10\%$   | 0402      |
| C17              | 4.7 $\mu$ F   | Capacitor, X7S, $\pm 10\%$   | 0603      |
| L1               | 4.7 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| L2               | 2.2 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| R1               | 4R7           | Resistor, $\pm 1\%$ , 0.063 W  | 0402      |
| U1               | nRF52833-QDAA | Multiprotocol <i>Bluetooth</i> <sup>®</sup> Low Energy, IEEE 802.15.4, ANT, and 2.4 GHz proprietary System on Chip | QFN-40    |
| X1               | 32 MHz        | Crystal SMD 1612, 32 MHz, Cl=8 pF, Total Tol: $\pm 40$ ppm   | XTAL_1612 |
| X2               | 32.768 kHz    | Crystal SMD 2012, 32.768 kHz, Cl=9 pF, Total Tol: $\pm 50$ ppm   | XTAL_2012 |

| X1               | 32 MHz        | Crystal SMD 1612, 32 MHz, Cl=8 pF, Total Tol: $\pm 40$ ppm   | XTAL_1612 |
| X2               | 32.768 kHz    | Crystal SMD 2012, 32.768 kHz, Cl=9 pF, Total Tol: $\pm 50$ ppm   | XTAL_2012 |

Table 167: Bill of material for circuit configuration no. 4

### 7.3.11 Circuit configuration no. 5 for QDAA QFN40

This section contains a configuration summary, a schematic, and bill of materials table for QDAA QFN40 circuit configuration number 5.

| Config no. | Supply configuration |                        | Enabled features |     |     |
|------------|----------------------|------------------------|------------------|-----|-----|
|            | VDDH                 | VDD                    | DCDCEN1          | USB | NFC |
| Config. 5  | N/A                  | Battery/Ext. regulator | Yes              | Yes | Yes |

Table 168: Configuration summary for circuit configuration no. 5

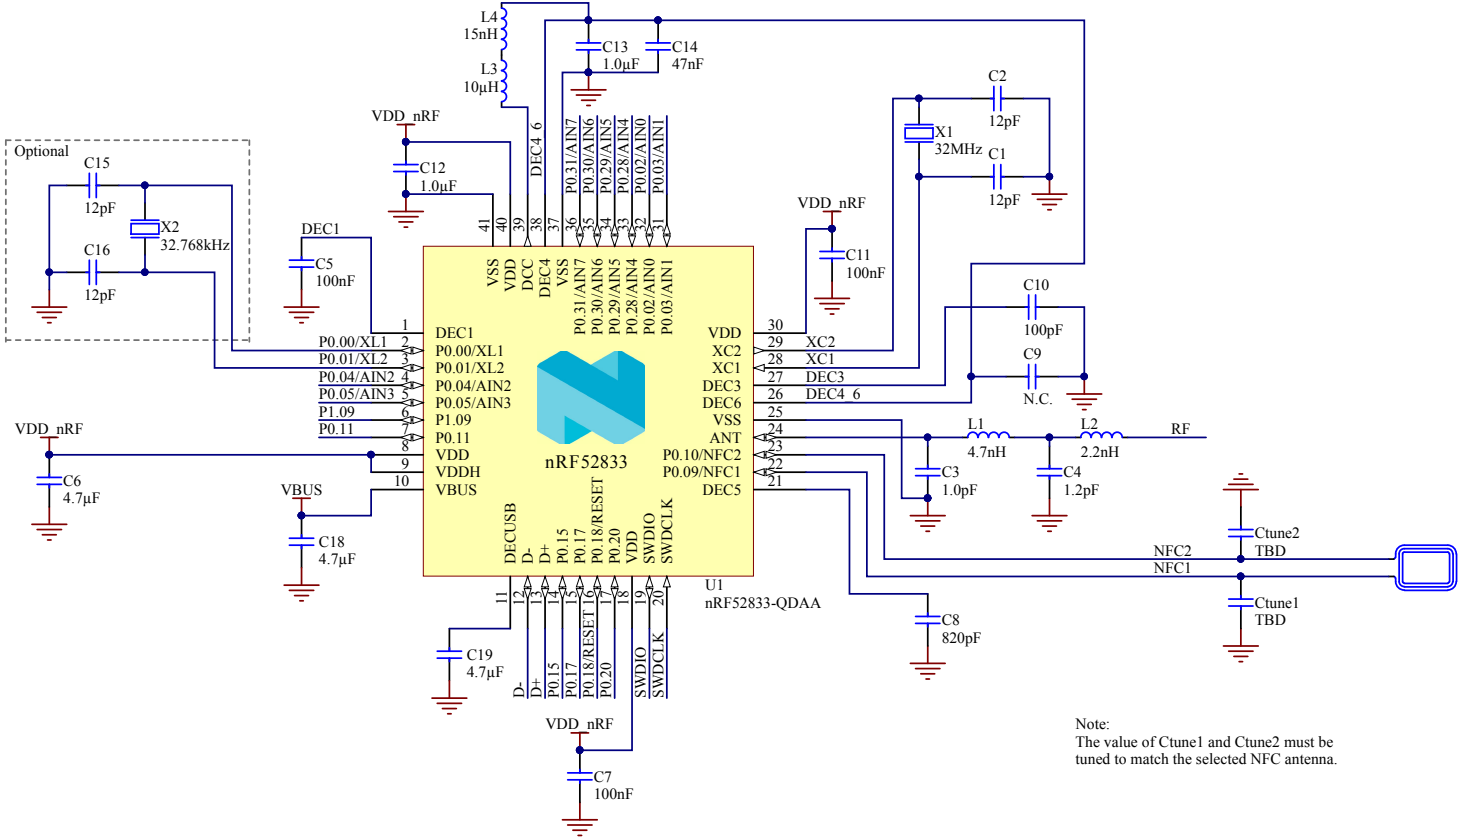

Figure 207: Circuit configuration no. 5 schematic for QDAA QFN40

**Note:** For PCB reference layouts, see the product page for the nRF52833 on [www.nordicsemi.com](http://www.nordicsemi.com).

| Designator       | Value         | Description  | Footprint |
|------------------|---------------|--|-----------|
| C1, C2, C15, C16 | 12 pF         | Capacitor, NPO, $\pm 2\%$  | 0201      |
| C3               | 1.0 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C4               | 1.2 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C5, C7, C11      | 100 nF        | Capacitor, X7S, $\pm 10\%$   | 0201      |
| C6, C19          | 4.7 $\mu$ F   | Capacitor, X7R, $\pm 10\%$   | 0603      |
| C8               | 820 pF        | Capacitor, X7R, $\pm 10\%$   | 0201      |
| C9               | N.C.          | Not mounted  | 0201      |
| C10              | 100 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C12, C13         | 1.0 $\mu$ F   | Capacitor, X7S, $\pm 10\%$   | 0402      |
| C14              | 47 nF         | Capacitor, X7S, $\pm 10\%$   | 0201      |
| C18              | 4.7 $\mu$ F   | Capacitor, X7S, $\pm 10\%$   | 0603      |
| Ctune1, Ctune2   | TBD           | Capacitor, X7R, $\pm 10\%$   | 0201      |
| L1               | 4.7 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| L2               | 2.2 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| L3               | 10 $\mu$ H    | Chip inductor, IDC, min = 50 mA, $\pm 20\%$  | 0603      |
| L4               | 15 nH         | High frequency chip inductor, $\pm 10\%$   | 0402      |
| U1               | nRF52833-QDAA | Multiprotocol <i>Bluetooth</i> <sup>®</sup> Low Energy, IEEE 802.15.4, ANT, and 2.4 GHz proprietary System on Chip | QFN-40    |
| X1               | 32 MHz        | Crystal SMD 1612, 32 MHz, Cl=8 pF, Total Tol: $\pm 40$ ppm   | XTAL_1612 |
| X2               | 32.768 kHz    | Crystal SMD 2012, 32.768 kHz, Cl=9 pF, Total Tol: $\pm 50$ ppm   | XTAL_2012 |

Table 169: Bill of material for circuit configuration no. 5

### 7.3.12 Circuit configuration no. 6 for QDAA QFN40

This section contains a configuration summary, a schematic, and bill of materials table for QDAA QFN40 circuit configuration number 6.

| Config no. | Supply configuration |                        | Enabled features |     |     |
|------------|----------------------|------------------------|------------------|-----|-----|
|            | VDDH                 | VDD                    | DCDCEN1          | USB | NFC |
| Config. 6  | N/A                  | Battery/Ext. regulator | No               | No  | No  |

Table 170: Configuration summary for circuit configuration no. 6

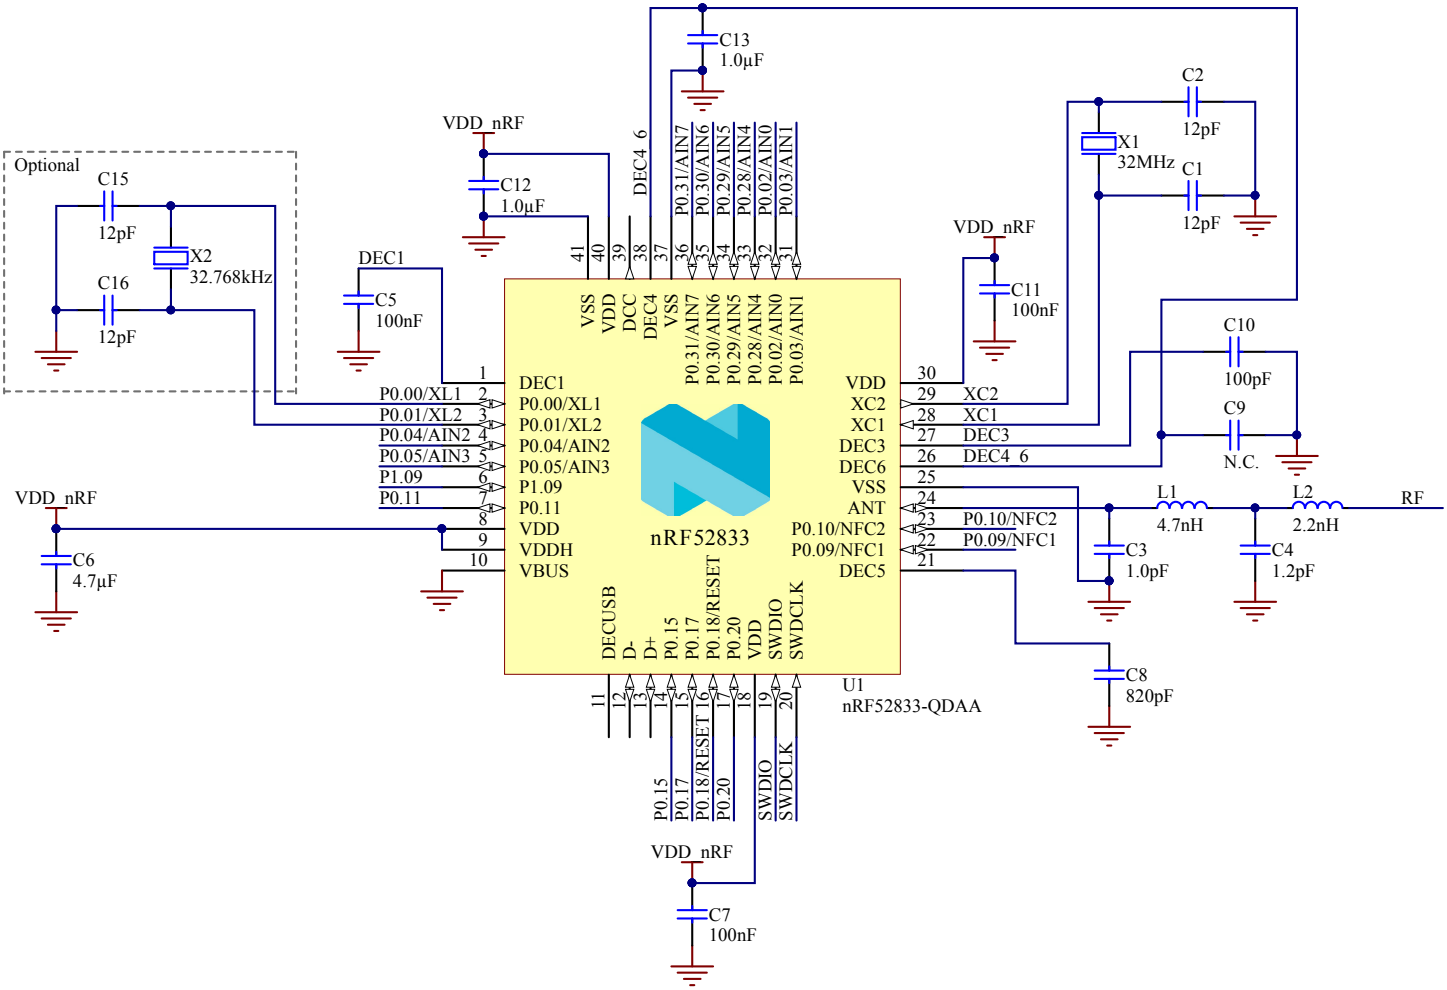

Figure 208: Circuit configuration no. 6 schematic for QDAA QFN40

**Note:** For PCB reference layouts, see the product page for the nRF52833 on [www.nordicsemi.com](http://www.nordicsemi.com).

| Designator       | Value         | Description  | Footprint |
|------------------|---------------|--|-----------|
| C1, C2, C15, C16 | 12 pF         | Capacitor, NPO, $\pm 2\%$  | 0201      |
| C3               | 1.0 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C4               | 1.2 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C5, C7, C11      | 100 nF        | Capacitor, X7S, $\pm 10\%$   | 0201      |
| C6               | 4.7 $\mu$ F   | Capacitor, X7R, $\pm 10\%$   | 0603      |
| C8               | 820 pF        | Capacitor, X7R, $\pm 10\%$   | 0201      |
| C9               | N.C.          | Not mounted  | 0201      |
| C10              | 100 pF        | Capacitor, NPO, $\pm 5\%$  | 0201      |
| C12, C13         | 1.0 $\mu$ F   | Capacitor, X7S, $\pm 10\%$   | 0402      |
| L1               | 4.7 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| L2               | 2.2 nH        | High frequency chip inductor, $\pm 5\%$  | 0201      |
| U1               | nRF52833-QDAA | Multiprotocol <i>Bluetooth</i> <sup>®</sup> Low Energy, IEEE 802.15.4, ANT, and 2.4 GHz proprietary System on Chip | QFN-40    |
| X1               | 32 MHz        | Crystal SMD 1612, 32 MHz, Cl=8 pF, Total Tol: $\pm 40$ ppm   | XTAL_1612 |
| X2               | 32.768 kHz    | Crystal SMD 2012, 32.768 kHz, Cl=9 pF, Total Tol: $\pm 50$ ppm   | XTAL_2012 |

Table 183: Bill of material for circuit configuration no. 6

### 7.3.19 PCB guidelines

A well designed PCB is necessary to achieve good RF performance. Poor layout can lead to loss in performance or functionality.

A qualified RF layout for the IC and its surrounding components, including matching networks, can be downloaded from [www.nordicsemi.com](http://www.nordicsemi.com).

To ensure optimal performance it is essential that you follow the schematics and layout references closely. Especially in the case of the antenna matching circuitry (components between device pin ANT and the antenna), any changes to the layout can change the behavior, resulting in degradation of RF performance or a need to change component values. All reference circuits are designed for use with a 50  $\Omega$  single-ended antenna.

A PCB with a minimum of four layers, including a ground plane, is recommended for optimal performance. On the inner layers, put a keep-out area on the inner layers directly below the antenna matching circuitry (components between device pin ANT and the antenna) to reduce the stray capacitances that influence RF performance.

A matching network is needed between the RF pin ANT and the antenna, to match the antenna impedance (normally 50  $\Omega$ ) to the optimum RF load impedance for the chip. For optimum performance, the impedance for the matching network should be set as described in the recommended package reference circuitry in [Reference circuitry](#) on page 567.

The DC supply voltage should be decoupled as close as possible to the VDD pins with high performance RF capacitors. See the schematics for recommended decoupling capacitor values. The supply voltage for the chip should be filtered and routed separately from the supply voltages of any digital circuitry.

Long power supply lines on the PCB should be avoided. All device grounds, VDD connections, and VDD bypass capacitors must be connected as close as possible to the IC. For a PCB with a topside RF ground plane, the VSS pins should be connected directly to the ground plane. For a PCB with a bottom ground

plane, the best technique is to have via holes as close as possible to the VSS pads. A minimum of one via hole should be used for each VSS pin.

Fast switching digital signals should not be routed close to the crystal or the power supply lines. Capacitive loading of fast switching digital output lines should be minimized in order to avoid radio interference.

### 7.3.20 PCB layout example

The PCB layout shown in the following figures is a reference layout for the aQFN™ package with internal LDO setup and VBUS supply.

**Note:** Pay attention to how the capacitor C3 is grounded. It is not directly connected to the ground plane, but grounded via VSS\_PA pin F23. This is done to create additional filtering of harmonic components.

For all available reference layouts, see the product page for the nRF52833 on [www.nordicsemi.com](http://www.nordicsemi.com).

Figure 219: Bottom layer

**Note:** No components in bottom layer.

## 7.4 Package thermal characteristics

A summary of the thermal characteristics for the different packages available for the IC can be found below.

| Symbol               | Package | Typ.   | Unit |
|----------------------|---------|--------|------|
| $\theta_{JA,aQFN73}$ | aQFN73  | 74.60  | °C/W |
| $\theta_{JA,QFN40}$  | QFN40   | 136.59 | °C/W |
| $\theta_{JA,WLCSP}$  | WLCSP   | 93.09  | °C/W |

Table 184: Package thermal characteristics

Values obtained by simulation following the EIA/JESD51-2 for still air condition.

## 7.5 Package Variation

The following describes the variation between the stated parameters in this specification and the values for the specific device package.

### 7.5.1 aQFN73

The parameter variation when using the aQFN73 package is as follows:

| Symbol                    | Min. | Typ.              | Max. | Unit |
|---------------------------|------|-------------------|------|------|
| $P_{SENS,IEEE\ 802.15.4}$ |      | -99               |      | dBm  |
| $P_{SENS,IT,SP,1M,BLE}$   |      | -95               |      | dBm  |
| $P_{RF}$                  |      | 7.5 <sup>42</sup> |      | dBm  |

Table 185: aQFN73 Package variation

<sup>42</sup> Achieved using  $P_{OS} 8\text{dBm}$  setting in **RADIO.TXPOWER**

# 8 Recommended operating conditions

The operating conditions are the physical parameters that the chip can operate within.

| Symbol              | Parameter                                       | Min. | Nom. | Max. | Units |
|---------------------|---|------|------|------|-------|
| VDD                 | VDD supply voltage, independent of DCDC enable  | 1.7  | 3.0  | 3.6  | V     |
| VDDPOR              | VDD supply voltage needed during power-on reset | 1.75 |      |      | V     |
| VDDH                | VDDH supply voltage                             | 2.5  | 3.7  | 5.5  | V     |
| VBUS                | VBUS USB supply voltage                         | 4.35 | 5.0  | 5.5  | V     |
| t <sub>R_VDD</sub>  | Supply rise time (0 V to 1.7 V)                 |      |      | 60   | ms    |
| t <sub>R_VDDH</sub> | Supply rise time (0 V to 3.7 V)                 |      |      | 100  | ms    |
| T <sub>A</sub>      | Operating temperature                           | -40  | 25   | 85   | °C    |
| T <sub>AEXT</sub>   | Extended operating temperature                  | 85   |      | 105  | °C    |
| T <sub>J</sub>      | Junction temperature                            |      |      | 110  | °C    |

Table 186: Recommended operating conditions

**Note:** The on-chip power-on reset circuitry may not function properly for rise times longer than the specified maximum.

## 8.1 Extended Operating Temperature

The operating temperature range for the device is defined in [Recommended operating conditions](#) on page 608. The range extends from T<sub>A</sub> minimum to T<sub>AEXT</sub> maximum.

Some electrical parameters are valid only for the T<sub>A</sub> operating temperature conditions. When this is the case an additional parameter for the T<sub>AEXT</sub> extended operating temperature condition is provided.

**Note:** When running the device in the extended operating temperature conditions range, the register [LFXODEBOUNCE](#) on page 92 must be set to `Extended`.

To avoid surpassing the maximum die junction temperature, see [Recommended operating conditions](#) on page 608, it is important to minimize current consumption when operating in the extended operating temperature conditions. It is therefore recommended to use the device in Normal Voltage mode with DC/DC enabled. See [POWER — Power supply](#) on page 58 for details about main supply modes.

## 8.2 WLCSP light sensitivity

All WLCSP package variants are sensitive to visible and close-range infrared light. This means that a final product design must shield the chip properly, either by final product encapsulation or by shielding/coating of the WLCSP device.

Some WLCSP package variants have a backside coating, where the marking side of the device is covered with a light absorbing film, while the side edges and the ball side of the device are still exposed and need to be protected. Other WLCSP package variants do not have any such protection.

The WLCSP package variant CJAA has a backside coating.

# 9 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.<sup>43</sup>

|   | Note                               | Min.   | Max.      | Unit               |
|---|------------------------------------|--------|-----------|--------------------|
| <b>Supply voltages</b>                              |                                    |        |           |                    |
| VDD   |                                    | -0.3   | +3.9      | V                  |
| VDDH  |                                    | -0.3   | +5.8      | V                  |
| VBUS  |                                    | -0.3   | +5.8      | V                  |
| VSS   |                                    |        | 0         | V                  |
| <b>I/O pin voltage</b>                              |                                    |        |           |                    |
| $V_{I/O}$ , VDD ≤ 3.6 V                             |                                    | -0.3   | VDD + 0.3 | V                  |
| $V_{I/O}$ , VDD > 3.6 V                             |                                    | -0.3   | 3.9       | V                  |

| Retention at 105 °C-85 °C, execution split          | Limited to 1000 write/erase cycles | 6.7    |           | years              |

75% execution time at 85 °C or less

Table 187: Absolute maximum ratings

<sup>43</sup> For accelerated life time testing (HTOL, etc) supply voltage should not exceed the recommended operating conditions max value, see [Recommended operating conditions](#) on page 608.

# 10 Ordering information

This chapter contains information on IC marking, ordering codes, and container sizes.

## 10.1 IC marking

The nRF52833 package is marked as shown in the following figure.

|    |    |    |    |    |     |
|----|----|----|----|----|-----|
| N  | 5  | 2  | 8  | 3  | 3   |
| <P | P> | <V | V> | <H | <P> |
| <Y | Y> | <W | W> | <L | L>  |

Figure 220: Package marking

## 10.2 Box labels

The following figures show the box labels used for nRF52833.

Table 188: Abbreviations

## 10.4 Code ranges and values

Defined here are the nRF52833 code ranges and values.

| <PP> | Package | Size (mm)     | Pin/Ball count | Pitch (mm) |
|------|---------|---------------|----------------|------------|
| QI   | aQFN™   | 7 x 7         | 73             | 0.5        |
| QD   | QFN     | 5 x 5         | 40             | 0.4        |
| CJ   | WLCSP   | 3.175 x 3.175 | 75             | 0.35       |

Table 189: Package variant codes

| <VV> | Flash (kB) | RAM (kB) |
|------|------------|----------|
| AA   | 512        | 128      |

Table 190: Function variant codes

| <H>       | Description  |
|-----------|--|
| [A . . Z] | Hardware version/revision identifier (incremental) |

Table 191: Hardware version codes

| <P>       | Description                                 |
|-----------|---|
| [0 . . 9] | Production device identifier (incremental)  |
| [A . . Z] | Engineering device identifier (incremental) |

Table 192: Production configuration codes

| <F>                | Description                              |
|--------------------|--|
| [A . . N, P . . Z] | Version of preprogrammed firmware        |
| [0]                | Delivered without preprogrammed firmware |

Table 193: Production version codes

| <YY>        | Description                   |
|-------------|-------------------------------|
| [00 . . 99] | Production year: 2000 to 2099 |

Table 194: Year codes

| <WW>       | Description        |
|------------|--------------------|
| [1 . . 52] | Week of production |

Table 195: Week codes

| <LL>        | Description                     |
|-------------|---------------------------------|
| [AA . . ZZ] | Wafer production lot identifier |

Table 196: Lot codes

| <CC> | Description |
|------|-------------|
| R7   | 7" Reel     |
| R    | 13" Reel    |

## 10.5 Product options

Defined here are the nRF52833 product options.

| Order code       | MOQ <sup>44</sup> |
|------------------|-------------------|
| nRF52833-QIAA-R7 | 800               |
| nRF52833-QIAA-R  | 3000              |
| nRF52833-QDAA-R7 | 1500              |
| nRF52833-QDAA-R  | 4000              |
| nRF52833-CJAA-R7 | 1500              |
| nRF52833-CJAA-R  | 7000              |

*Table 198: nRF52833 order codes*

| Order code  | Description              |
|-------------|--------------------------|
| nRF52833-DK | nRF52833 Development Kit |

# 11 Legal notices

By using this documentation you agree to our terms and conditions of use. Nordic Semiconductor may change these terms and conditions at any time without notice.

## Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function, or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

Nordic Semiconductor ASA does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. If there are any discrepancies, ambiguities or conflicts in Nordic Semiconductor's documentation, the Product Specification prevails.

Nordic Semiconductor ASA reserves the right to make corrections, enhancements, and other changes to this document without notice.

## Life support applications

Nordic Semiconductor products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury.

Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.

## RoHS and REACH statement

Refer to [www.nordicsemi.com](http://www.nordicsemi.com) for complete hazardous substance reports, material composition reports, and latest version of Nordic's RoHS and REACH statements.
